RFE Project No. 21335

TABLE OF CONTENTS

APPENDIX

A. PROJECT LOCATION

The proposed project is located at the southeast corner of the intersection of White Rock Road and Latrobe at 1010 White Rock Road in El Dorado Hills, County of El Dorado, State of California. The approximate coordinates of the project site are latitude 38.646036° north and longitude 121.067261° west. The project site and shed areas encompasses about 14.95 acres, inclusive of APN's: 118-010-12 and a portion of APNs 118-010-14 & 15, as well as off-site street improvements along Latrobe Road. The project's location is shown on the Vicinity Map in Appendix A.

B. EXISTING SITE CONDITIONS

In its existing condition, the majority of the site is undeveloped with well-established grasses and intermittent trees. The terrain would be best described as rolling hills. The area generally is divided into three main shed areas. Shed area A-X1 (as shown on the Pre-Construction Shed Map, SM1 in Appendix B) includesapproximately 27% of the overall project site, and slopes in an easterly direction, toward an existing concrete drainage ditch along the east property line. Shed A-X2 envelopes over half of the project site (approximately 56%) and slopes in a southwesterly direction toward Latrobe Road. It is tributary to an existing 24" storm drain that passes beneath Latrobe Road, approximately 1,150 feet south of the intersection of Latrobe Road and White Rock Road. Shed A-X3 is about 13% of the project site and is located at the southern tip of the site. The shed slopes in a westerly direction toward another 24" storm drain that passes beneath Latrobe Road. Two smaller sheds (approximately 4%) to the north flow into the existing site storm drain system. The highest part of the dividing ridge is located at the southeast corner of the adjacent Pottery World property, APN 118-010-14, at an elevation of about 638 feet. The terrain slopes radially away from this area.

The east facing slope is relatively steep, with slopes up to about 3:1. There is a concrete drainage ditch located near the east property line, which runs along the back of the existing residential lots, intercepts the runoff and conveys it northerly to a drainage inlet near the far northeast corner of the property. The terrain slopes back up to the residential homes east of the concrete ditch. The west and southwest facing slopes toward Latrobe Road are also relatively steep with slopes up to about 5:1. There are rock lined drainage ditches along the east side of Latrobe Road which intercept runoff from the subject property and convey flows to two separate 24-inch culvert crossings of Latrobe Road. The majority of the east side of Latrobe Road has AC dikes, which convey the road run-off by overside drains into these respective ditches. One culvert crossing is on the west side of an existing driveway apron turnout about 790 feet north of the south property corner. The other is east of the driveway apron about 235 feet north of the south property corner. Flows from these culverts discharge on the west side of Latrobe Road and flow west into an existing channel that is tributary to Carson Creek. Cason Creek is tributary to Deer Creek, which is tributary to the Cosumnes River. Table 1 below summarizes the surrounding properties. Site conditions can be found on the Pre Construction Shed Map SM1 located in Appendix B.

TABLE 1: SITE DESCRIPTION (SURROUNDING AREAS)

North	Developed commercial shopping / retail center and White Rock Road beyond
South	Latrobe Road and Golden Foothill Pkwy intersection
East	Cresleigh El Dorado Residential Subdivision
West	Latrobe Road

The site contains two different soil types, both identified as Hydrologic Group D, which is generally characterized by low infiltration. These soils include Auburn silt loam, and Auburn very rocky silty loam. See Appendix C for soils information. In discussions with the geotechnical engineer for this project, we have assumed zero infiltration for drainage and stormwater quality calculations due to the shallow bedrock on this property and the engineered fill required for the project site.

The project site is not located within a floodplain (Zone X). See a project Firmette in Appendix F.

C. PROPOSED PROJECT DESCRIPTION

The project involves the construction of 10 new buildings. Building 1 is proposed as a two-story structure with the first floor as retail use and the second floor as office use. Buildings 2, 4, 6 and 8 are designated as single story retail. Buildings 3, 5, and 7 are proposed restaurants, with a drive-thru proposed for Building 7. Building 9 is proposed office use. Building 10 is a proposed four story hotel with the main entrance, offices, and meeting rooms on the first floor and guest rooms on floors 2 - 4. In total, approximately 127,322 square feet of new building is proposed with this project. The exact square footage of each building will be identified during the design phase of the project.

The project will also include paved driveways and parking facilities to serve all of the buildings. The driveways will connect the already developed portions of Montano de El Dorado to the north to the proposed project at three different locations and will provide good vehicular circulation for the overall site. Two new driveways along the Latrobe Road frontage are proposed as well. The middle driveway will be the main entrance off Latrobe Road with a signalized intersection. The more southern driveway is proposed as right-in right-out only. In addition to the paved driveways and parking areas, site hardscape will provide an accessible path of travel throughout the entire development. Landscaping proposed is consistent with El Dorado County standards.

Due to the substantial grade differential from Latrobe Road to the top of the site, retaining walls are proposed along the Latrobe Road frontage to match in type and kind the walls that have already been constructed. The tallest retained height of the wall along Latrobe Road is expected to be near the northwest corner of Building 8 where the wall is estimated to be about 19 feet tall. A retaining wall is also proposed along the east property line. The northern portion will retain soils from the project site, which is higher than the adjacent residential homes. Northeast of Building 2 the wall reverses and starts retaining soil from the adjacent site as the proposed project elevations are lower.

Many additional internal retaining walls are proposed on-site due to the large grade differential as stated above.

New curb, gutter, and sidewalk are also proposed as part of this project frontage improvements along the entire Latrobe Road frontage. The curb, gutter, and sidewalk will be constructed based on the existing right-of-way and a 4-Lane Divided Roadway with a 6-ft wide shoulder (includes gutter pan of curb and gutter) and a 6-foot wide sidewalk. However, the new retaining walls along Latrobe Road are proposed behind the new proposed right-of-way, which is based on an ultimate design of a 6-Lane Divided Road per El Dorado County Standard Plan RS-01. The proposed 4-lane layout provides a small strip of landscaped area between the back of the sidewalk and retaining wall which will serve as an aesthetically pleasing buffer for the sites frontage.

New storm drain, sanitary sewer, and water lines are being proposed to serve the new development, in compliance with El Dorado County Stormwater and El Dorado Irrigation District requirements, respectively. New storm drain improvements will also include both on-site and off-site drainage inlets, manholes and drain lines designed to collect and convey stormwater to one of the two 24" storm drains passing beneath Latrobre Road. On-site storm drainage will implement a series network of Low Impact Development (LID) in conjunction with underground stormwater detention piping to detain runoff and mitigate to pre-development flows prior to leaving the site. The LID measures will provide water quality as well as attenuation of the peak flows prior to entering the underground detention system. The preliminary design of the on-site storm drainage is presented in greater detail in Sections G and H of this Report.

The total area to be disturbed will be approximately 15 acres including both on-site and off-site improvements. Site improvements can be seen on the Site Plan and the Preliminary Grading, Drainage and Paving Plans C1 & C2 in Appendix A.

D. PURPOSE OF REPORT

The purpose of this report is to present the preliminary design of the storm drain system and to demonstrate that the design is in compliance with the El Dorado County Drainage Manual, dated March 14, 1995 and the Western El Dorado County Storm Water Management Plan (SWMP), dated August 2004. Per El Dorado County drainage requirements, 10-year event peak flows from the site must be detained and attenuated to match or be less than the pre-development flows. Additionally, the design must provide an overland conveyance system to accommodate the 100-year peak flow. The report demonstrates that the preliminary drainage design meets both these El Dorado County drainage requirements.

This report has also been structured to present stormwater quality measures to be implemented as Best Management Practices (BMPs) in accordance with the SWMP and CASQA Stormwater Pollution Prevention Plan. Per the SWMP, this project falls under the Project Type 5 category because more than one acre of impervious area will be created. In addition to the water quality and source control measures, Type 5 projects require hydromodification such that the 2-year, 24 hour storm does not increase from the pre development to post development condition. This report

demonstrates that the preliminary drainage design meets the Project Type 5 requirements set forth by the SWMP.

The report is divided into four (4) main parts:

A. Description of existing drainage conditions and evaluation of existing storm drain system.

B. Description and evaluation of the post-construction runoff, proposed storm drain system, and water quality treatment.

C. Conclusions.

D. Recommendations.

E. EXISTING STORM DRAINAGE CONDITIONS

As previously mentioned in Section B, the proposed project site is located on hilly terrain with the top of the hill located at the southeast corner of the adjacent Pottery World property (APN:118-010-14). The elevation at this area is about 638 feet. The elevation along Latrobe Road varies significantly along the project site frontage. At the northwestern most corner of the project site, the elevation at Latrobe Road is approximately 597 feet. Approximately 690 feet north of the south property corner, Latrobe Road dips down to an elevation of about 574 feet. Based on these values, there is a grade differential of between 41- 64 feet from the top of the existing hill to Latrobe Road. The portion of the project site that sheds toward the gravel-lined drainage ditches along the east side of Latrobe Road are designated by Sheds A-X2 and A-X3 on the Pre-Construction Shed Map - SM1. Each of these two sheds are tributary to one of two 24" storm drain pipes that convey water westerly, beneath Latrobe Road, outfalling on the west side of the road. Shed A-X1 on Shed Map SM1 delineates the shed area within the proposed project site that currently drains to the concrete drainage channel running along the east property line toward an existing drainage inlet near White Rock Road. Sheds A-X4 and A-X5 represent areas within the project area that, in the existing condition, discharge to the on-site storm drain network of the north-adjacent parcels. Sheds A-X4 and A-X5 are shown for comparison of land coverage between the pre and post construction condition.

To evaluate both pre and post-construction runoff, RFE used the USDA Urban Hydrology for Small Watersheds TR-55 Manual, an accepted method of hydrologic analysis for El Dorado County. The method outlined by the TR-55 utilizes equations based on shed area, ground cover, and ground slope to determine maximum storm flow response times and resultant peak flows. The existing land coverage within the proposed project development envelope is about 3.26% impervious. Using the values from Table 2-2a from the USDA Urban Hydrology for Small Watersheds TR-55 method, the resultant curve numbers (CN) assuming a CN of 80 for pervious areas and a CN of 98 for impervious areas. After establishing the CNs for the shed areas and the time of concentration paths for the shed areas (See Shed Map SM-1 in Appendix B), peak runoff for the 2-Yr and 10-Yr storm events were

estimated. The calculations for the determination of the estimated peak runoff flows are presented in Appendix E and applicable peak flow values also noted within this study.

Two pre-construction scenarios were evaluated for comparison in separate post-construction design calculations. The estimated 2-year 24-hour storm event peak flow was estimated for the overall site for comparison with the same post-construction storm event for post-construction to show consistency with the El Dorado County requirements. The estimated 2-year and 10-year pre-construction peak flows were also estimated for the larger southwest shed A-X2 only as the basis of comparison with the post-construction peak flows after detention that discharge into the existing 24-inch storm drain culverts crossing Latrobe Road.

F. POST-CONSTRUCTION STORM DRAINAGE CONDITIONS

As previously explained, the preliminary post-construction storm drainage system was design to satisfy requirements of the El Dorado County Drainage Manual as well as the Western El Dorado County SWMP. The key considerations for this project based on each of these two design guidelines are as follows:

El Dorado County Drainage Manual –

Safely convey the storm runoff from an event with an average recurrence interval of 10 years without the headwater depth exceeding the culvert barrel height.

The depth of flow or ponding shall not exceed a level which would cause inundation of building sites. One foot of freeboard shall be maintained between building finished floor elevation and water surface elevation resulting from a storm runoff event with an average recurrence interval of 100 years.

The post development 10-Year peak flow shall not exceed the pre development 10-Year peak flow.

Western El Dorado County SWMP -

Provide site design measures, source controls, and storm water quality treatment consistent with the SWMP. Size the stormwater quality treatment / low impact development measures to sufficiently treat the 85th percentile 24-hour storm event capture

Verify that post development flows will not exceed pre development flows for the 2-year, 24-hour storm.

In order to satisfy the requirements outlined above, the project will implement a number of LID measures in conjunction with downstream underground detention facilities. To provide water quality treatment the LID measures proposed includes rooftop and impervious area disconnection into biofiltration facilities. French drains are proposed for the standard above-ground bioretention

facilities due to the very poor infiltration rates at the site. After the water filters through the engineered soil and pollutants are removed, the water will flow into the French drains and connect into the underground storm drainage network. These biofiltration facilities are proposed within landscape areas as much as feasible.

In addition to the LID measures listed in the SWMP, this project will utilized Filterra Stormwater quality units in areas where typical bioretention/biofiltration facilities are not feasible. The Filterra units treat the stormwater in a similar fashion as bioretention/biofiltration facilities as described in the CASQA BMP TC-32 for Bioretention. Storm water is treated by flowing through a layer of engineered soil and then passes into a French drain at the bottom of the engineered soil and then is discharged into the site underground storm drain system. Additionally, the filterra includes a shrub or small tree planted within the filter soil that provides additional nutrient uptake as the water flows through the engineered soil.

For the parking area and drive aisle in front of Buildings 5 and 6, the use of bioretention/biofiltration systems and filterra inlets are not as easily applied. Therefore, for this smaller area stormfilter inlets are proposed to filter the stormwater before discharging into the on-site storm drain system.

After the stormwater has been treated via bioretention/biofiltration, filterra units, or Stormfilters, the water will be conveyed via storm drain pipes to one of two underground detention systems. The north detention system is located under the parking lot north of Building 5 and 6. This system will receive runoff from north of the main driveway entrance, including Buildings 1, 2, 3, 5, 6, and 10. The south detention system is located in the 8 driveway and will receive runoff south of the main driveway, including Buildings 4, 7, 8, and 9. For the purposes of preliminary design, the post-development condition assumes 90% impervious land coverage. See Shed Maps SM2 and SM3 in Appendix B for the post-construction shed delineations.

G. STORM DRAINAGE EVALUATION

As noted above in Section E, RFE used the USDA Urban Hydrology for Small Watersheds TR-55 Manual to estimate the pre-construction and post-construction peak flows for the project. The method outlined by the TR-55 utilizes equations based on shed area, ground cover, and ground slope to determine maximum storm flow response times and resultant peak flows.

After the shed boundaries were estimated for each of the storm drain nodes in the proposed post-construction site, the respective overall time of concentration paths of travel were determined for both the north and south detention systems. Because this report is only in the preliminary stage, individual shed analysis for time of concentration paths of travel was not conducted. This will be performed with the design drainage study as part of the improvement plans phase for this project. The final design drainage study will include the calculation of peak flows at each node with the related pipe flow hydraulics calculations. For the preliminary phase, one of the primary focus points was on the necessary detention volume required to attenuate the post-construction 2-Yr and 10-Yr peak

flows to pre-construction levels or below, comparing to the applicable pre-construction flows from shed area A-X2 only. Once the tributary sheds were established and time of concentration paths were established for each system, we estimated the resultant peak flow runoffs and then estimated the necessary detention requirements. The table below presents the pre and post development peak flows as well as the peak flows with the detention systems:

TABLE 2: PRE AND POST DEVELOPMENT PEAK FLOWS

	Area (AC)	Curve No. (CN)	Time of Conc. (min)	2-Yr Peak (cfs)	10-Yr Peak (cfs)
Pre-Development Shed A-X1	4.092	80	23.90	1.404	3.219
Pre-Development Shed A-X2	8.336	80	24.10	2.863	6.564
Pre-Development Shed A-X3	1.887	80	22	0.708	1.620
Post-Development North System	8.030	96	6.50	12.21	18.83
Post-Development South System	5.270	96	2.70	8.72	13.48
Post-Development North System (w/detention)	-	-	-	2.448	6.446
Post-Development South System (w/detention)	-	-	-	0.638	1.539

In order to attenuate and detain the post-construction stormwater runoff to the levels shown in the above table, the north system will have 5 rows of 48-inch perforated storm drain pipe side by side, 400 feet in length. The south system will have 4 rows of 48-inch perforated storm drain pipe side by side, 400 feet in length. Each system will be connected to a metering manhole which will meter the flows to pre-development conditions before leaving the site.

There are two small areas, about 0.21 acres combined, shown on Shed Map SM2 and labeled A-54 & A-57 which will not connect into either the North or South detention systems. The runoff from these area will be from a new paved parking area and a landscaped area. This new parking area will create about 4,000 square feet of new impervious area, replacing approximately 5,400 square feet of paved parking in this area that will be removed as part of this project. The runoff tributary to this parking lot will tie into the existing storm drain system to the west of the parking lot. Flows from the landscape area will flow down the loop road and into the storm. There is approximately 3,000 square feet of impervious area in Shed A-27 that, in the existing condition, discharges to the Pottery World storm drain system. With the proposed development, this area will be tributary to the North Detention System, no longer discharging into the existing development's system. Additionally, Shed Area A-33, in the existing state, discharges to the Pottery World storm drain system. This entire area will now be captured and conveyed to the North Detention System. Between the tributary areas removed from the existing development storm drain system (Sheds A-27 and A-33), the overall balance of stormwater should not increase from the Pre to Post Condition for the existing development's system. Additionally, the existing underground detention system constructed as part of the US Bank phase for the site, includes additional capacity for areas to the south of the US Bank to approximately the existing ridge area. This area now will flow into the new system as part of this project. Thus, there should be adequate capacity for the areas noted above that will flow into this existing system.

Each of the two storm drain detention systems will be connected to an outlet control metering manhole to meter the discharge to pre-development levels for the 2-year and 10-year storm events. The system has been design to keep the peak flowrates from the project site into the two 24" storm drains that pass beneath Latrobe Road at or below the pre-development flows from the site. Approximately 13.23 acres of the project site (88%) will have runoff conveyed to either the north or south detention systems, prior to being metered out to the existing 24" storm drains at or below pre-development levels for the 2-year and 10-year peak flows. The remaining 12% of the project site includes primarily off-site area along the Latrobe Road frontage, as well as the as site entry driveways and the areas described in the preceding paragraph. The metered discharge from the north system will tie into the existing 24" storm drain passing beneath Latrobe Road immediately west of proposed Building 7. The metered discharge from the south system will tie into the existing 24" storm drain passing beneath Latrobe Road immediately west of Building 9.

In the event that the underground storm drain becomes inundated or for storm events greater than a 10-Yr intensity, overland release locations are at each of the two proposed driveways. The

overland release elevation is 1.5' lower than the lowest building finished floor elevation which satisfies the El Dorado County requirement of 1.0'.

No stormwater quality calculations for the sizing of the bioretention facilities or Filterra stormwater quality units have been included with the preliminary design. The sizing calculations for each of the bioretention facilities and Filterra stormwater quality units will be part of the final design drainage report. The calculations will be in conformance to requirements outlined in section 4.5 of the Western El Dorado SWMP and per Section 5.5 of the CASQA BMP Handbook for New and Redevelopment.

H. CONCLUSIONS

- The preliminary drainage improvements were designed as per the standards of the El Dorado County Drainage Manual and the West El Dorado County SWMP. Post-Development 2-Yr and 10-Yr peak flows will be attenuated to match Pre-Development peak flows.
- Low impact development and water quality treatment BMPs used in design to treat stormwater runoff include rooftop and impervious area disconnection, bioretention facilities and Filterra stormwater quality units. Since this site has basically no infiltration due to bedrock and engineered fill over almost all of the site, the proposed LID identified appears to be the best feasible solution for the project.
- Two overland release locations will be provided with this development; one at each driveway along Latrobe Road. The elevation of the overland release is 590.50' for each of the two overland release locations, and the lowest building elevation is set at 592.00'. This will provide over 1.0' of freeboard for overland release, thereby satisfying the El Dorado County requirement.

I. RECOMMENDATIONS

In order to accommodate the estimated future condition peak flows and existing topographic conditions, as well as to provide the best feasible water quality treatment, it is recommended that the final design and construction include grading and storm drainage improvements consistent with the Preliminary Montano De El Dorado Phase III development plans and conclusions outlined in this preliminary drainage study.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Dorado Area, California
Survey Area Data: Version 7, Sep 15, 2014

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 15, 2011—Apr 29, 2012

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — El Dorado Area, California (CA624)				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
AkC	Argonaut gravelly loam, 2 to 15 percent slopes	D	2.6	11.1%
AwD	Auburn silt loam, 2 to 30 percent slopes	D	1.4	6.0%
AxD	Auburn very rocky silt loam, 2 to 30 percent slopes	D	19.1	82.9%
Totals for Area of Interest			**23.0**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Table 2-2a Runoff curve numbers for urban areas [1]

Cover description		Curve numbers for hydrologic soil group			
Cover type and hydrologic condition	Average percent impervious area [2]	A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.) [3]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only) [4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation) [5]		77	86	91	94
Idle lands (CN's are determined using cover types similar to those in table 2-2c).					

Pre-Development

Post-Development

[1] Average runoff condition, and $I_a = 0.2S$.

[2] The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.

[3] CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.

[4] Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.

[5] Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

West Slope Development and Redevelopment Standards and Post Construction Storm Water Plan Requirements

All qualifying cities and counties in California must comply with the requirements of a National Pollutant Discharge Elimination System (NPDES) permit administered by the State Water Resources Control Board and the nine Regional Boards beneath it. The unincorporated portion of El Dorado County's west slope is covered under a Phase II NPDES permit, which became effective on July 1, 2013. By July 1, 2015, this state mandated permit requires the County to address storm water runoff from new development and redevelopment projects, both during construction and after construction occurs. Projects subject to the requirements, as outlined below, must submit the appropriate Post Construction Storm Water Plan based on the project type. For additional El Dorado County NPDES information, please view the El Dorado County Storm Water Homepage.

Project Type 1: Exempt from Post Construction Requirements

Project Definition:

- **Projects that create or replace less than 2,500 square feet of impervious surface**
- **Linear Utility Projects that create less than 5,000 square feet of impervious surface**

Project Considerations	Your Submittal	MS4 Permit Reference
1. Limit clearing, grading and soil compaction. 2. Minimize impervious surfaces. 3. Direct runoff to landscaping and/or use porous pavements. 4. Conserve natural areas as much as possible consistent with local General Plan. 5. Comply with County slope and stream setback ordinances/requirements. 6. Comply with Chapter 15.14 El Dorado County Grading, Erosion, and Sediment Control Ordinance.	1. Refer to El Dorado County Building Services for Plan and application submittal requirements: http://www.edcgov.us/Building/.	N/A

Project Type 2: Small Projects and Single Family Homes

Project Definition: Projects that create or replace between 2,500 and 4,999 square feet of **impervious surface** . Linear utility projects are exempt. Additionally, projects that have been submitted prior to July 1, 2015 are exempt. Small and Single Family Home Projects do not include interior remodels, routine maintenance or repair such as: roof or exterior surface replacement, pavement resurfacing, and repaving within the existing footprint. Decks designed with spacing between boards can be excluded from the tally of impervious surface.

Project Requirements	Your Submittal	MS4 Permit Reference

1. Implement Exempt Project considerations. 2. Implement and direct water to one or more Site Design Measures. Click here for El Dorado County's Site Design Measures requirements.	1. Refer to El Dorado County Building Services for Plan and application submittal requirements: http://www.edcgov.us/Building/. 2. Complete Step 1 Table from the Site Design Measures Manual. 3. Include proposed impervious surface area and Site Design Measure(s) on your Site Plans (refer to the Site Design Measures Manual for guidance).	Section E.12.b. Site Design Measures (pages 48 and 49)

Project Type 3: Regulated Projects

Project Definition: Projects other than **single family homes** (unless they are part of a larger Common Plan of Development) that create or replace 5,000 square feet or more of **impervious surface** . **Single family homes** shall meet the above Project Type 2 requirements. Regulated projects do not include interior remodels, routine maintenance or repair such as: roof or exterior surface replacement, pavement resurfacing, and repaving within the existing footprint. Decks designed with spacing between boards can be excluded from the tally of impervious surface.

Project Requirements	Your Submittal	MS4 Permit Reference
1. Implement Exempt Project considerations. 2. Implement Site Design Measures provided above for Type 2 Projects. 3. Remaining runoff from the 85th percentile 24-hour storm event (~1 inch of water) shall be directed to one or more Storm Water Treatment and Baseline Hydromodification Measures using volumetric and/or flow-based sizing criteria. 4. Identify potential sources of pollutants and implement corresponding source control measures. Click here to access CASQA Source Control BMP Fact Sheets. 5. Provide ongoing maintenance of water retention and treatment facilities.	1. Refer to El Dorado County Building Services for plan and application submittal requirements: http://www.edcgov.us/Building/. 2. Site Plans showing Drainage Management Areas (DMAs), proposed impervious surface areas, Site Design Measures, Source Controls and Storm Water Treatment and Baseline Hydromodification Measures that are planned to be implemented on the site. 3. Calculations demonstrating 85th percentile 24-hour storm event capture and treatment for each DMA (can be included in a Drainage Report).	Section E.12.c. Regulated Projects through Section E.12.e. Low Impact Development (LID) Design Standards (pages 49 -55)

Project Type 4: Roads and Linear Underground/Overhead Projects (LUPs) (i.e., gas, water, sewer, and overhead power lines)

Project Definition: Projects that create 5,000 square feet or more of newly constructed contiguous **impervious surface** . Review MS4 Section E.12.c.(c) for specific exclusions.

Project Requirements	Your Submittal	MS4 Permit Reference

1. Implement Exempt Project considerations. 2. Implement Regulated Project requirements. Requirements for Roads and Linear Utility Projects can vary. Refer to Section E.12.c.(c) of the MS4 Permit to review variations.	1. Same as Regulated Projects. Refer to Section E.12.c.(c) of the MS4 Permit to review variations. This project	Same as Regulated Projects

Project Type 5: Hydromodifications Projects		
Project Definition: Projects that create or replace one acre or more of **impervious surface.**		
Project Requirements	**Your Submittal**	**MS4 Permit Reference**
1. Implement Exempt Project considerations. 2. Implement Regulated Project Requirements. 3. Implement Hydromodification Management Measures. Refer to Section E.12.f. of the MS4 Permit to review variations.	1. Same as Regulated Projects. 2. Verification showing post project flows will not exceed pre-project flow rate for the 2-year, 24-hour storm (can be included in a Drainage Report).	Section E.12.c. Regulated Projects through Section E.12.f. Hydromodification Management (pages 49 -57)

Bioretention TC-32

Design Considerations

- Soil for Infiltration
- Tributary Area
- Slope
- Aesthetics
- Environmental Side-effects

Description

The bioretention best management practice (BMP) functions as a soil and plant-based filtration device that removes pollutants through a variety of physical, biological, and chemical treatment processes. These facilities normally consist of a grass buffer strip, sand bed, ponding area, organic layer or mulch layer, planting soil, and plants. The runoff's velocity is reduced by passing over or through buffer strip and subsequently distributed evenly along a ponding area. Exfiltration of the stored water in the bioretention area planting soil into the underlying soils occurs over a period of days.

Targeted Constituents

✓	Sediment	■
✓	Nutrients	▲

✓	Organics	■

Legend ***(Removal Effectiveness)***

● Low ■ High

▲ Medium

California Experience

None documented. Bioretention has been used as a stormwater BMP since 1992. In addition to Prince George's County, MD and Alexandria, VA, bioretention has been used successfully at urban and suburban areas in Montgomery County, MD; Baltimore County, MD; Chesterfield County, VA; Prince William County, VA; Smith Mountain Lake State Park, VA; and Cary, NC.

Advantages

- Bioretention provides stormwater treatment that enhances the quality of downstream water bodies by temporarily storing runoff in the BMP and releasing it over a period of four days to the receiving water (EPA, 1999).
- The vegetation provides shade and wind breaks, absorbs noise, and improves an area's landscape.

Limitations

- The bioretention BMP is not recommended for areas with slopes greater than 20% or where mature tree removal would

CASQA California Stormwater Quality Association

be required since clogging may result, particularly if the BMP receives runoff with high sediment loads (EPA, 1999).

- Bioretention is not a suitable BMP at locations where the water table is within 6 feet of the ground surface and where the surrounding soil stratum is unstable.
- By design, bioretention BMPs have the potential to create very attractive habitats for mosquitoes and other vectors because of highly organic, often heavily vegetated areas mixed with shallow water.
- In cold climates the soil may freeze, preventing runoff from infiltrating into the planting soil.

Design and Sizing Guidelines

- The bioretention area should be sized to capture the design storm runoff.
- In areas where the native soil permeability is less than 0.5 in/hr an underdrain should be provided.
- Recommended minimum dimensions are 15 feet by 40 feet, although the preferred width is 25 feet. Excavated depth should be 4 feet.
- Area should drain completely within 72 hours.
- Approximately 1 tree or shrub per 50 ft^2 of bioretention area should be included.
- Cover area with about 3 inches of mulch.

Construction/Inspection Considerations

Bioretention area should not be established until contributing watershed is stabilized.

Performance

Bioretention removes stormwater pollutants through physical and biological processes, including adsorption, filtration, plant uptake, microbial activity, decomposition, sedimentation and volatilization (EPA, 1999). Adsorption is the process whereby particulate pollutants attach to soil (e.g., clay) or vegetation surfaces. Adequate contact time between the surface and pollutant must be provided for in the design of the system for this removal process to occur. Thus, the infiltration rate of the soils must not exceed those specified in the design criteria or pollutant removal may decrease. Pollutants removed by adsorption include metals, phosphorus, and hydrocarbons. Filtration occurs as runoff passes through the bioretention area media, such as the sand bed, ground cover, and planting soil.

Common particulates removed from stormwater include particulate organic matter, phosphorus, and suspended solids. Biological processes that occur in wetlands result in pollutant uptake by plants and microorganisms in the soil. Plant growth is sustained by the uptake of nutrients from the soils, with woody plants locking up these nutrients through the seasons. Microbial activity within the soil also contributes to the removal of nitrogen and organic matter. Nitrogen is removed by nitrifying and denitrifying bacteria, while aerobic bacteria are responsible for the decomposition of the organic matter. Microbial processes require oxygen and can result in depleted oxygen levels if the bioretention area is not adequately

aerated. Sedimentation occurs in the swale or ponding area as the velocity slows and solids fall out of suspension.

The removal effectiveness of bioretention has been studied during field and laboratory studies conducted by the University of Maryland (Davis et al, 1998). During these experiments, synthetic stormwater runoff was pumped through several laboratory and field bioretention areas to simulate typical storm events in Prince George's County, MD. Removal rates for heavy metals and nutrients are shown in Table 1.

Table 1 Laboratory and Estimated Bioretention Davis et al. (1998); PGDER (1993)

Pollutant	Removal Rate
Total Phosphorus	70-83%
Metals (Cu, Zn, Pb)	93-98%
TKN	68-80%
Total Suspended Solids	90%
Organics	90%
Bacteria	90%

Results for both the laboratory and field experiments were similar for each of the pollutants analyzed. Doubling or halving the influent pollutant levels had little effect on the effluent pollutants concentrations (Davis et al, 1998).

The microbial activity and plant uptake occurring in the bioretention area will likely result in higher removal rates than those determined for infiltration BMPs.

Siting Criteria

Bioretention BMPs are generally used to treat stormwater from impervious surfaces at commercial, residential, and industrial areas (EPA, 1999). Implementation of bioretention for stormwater management is ideal for median strips, parking lot islands, and swales. Moreover, the runoff in these areas can be designed to either divert directly into the bioretention area or convey into the bioretention area by a curb and gutter collection system.

The best location for bioretention areas is upland from inlets that receive sheet flow from graded areas and at areas that will be excavated (EPA, 1999). In order to maximize treatment effectiveness, the site must be graded in such a way that minimizes erosive conditions as sheet flow is conveyed to the treatment area. Locations where a bioretention area can be readily incorporated into the site plan without further environmental damage are preferred. Furthermore, to effectively minimize sediment loading in the treatment area, bioretention only should be used in stabilized drainage areas.

Additional Design Guidelines

The layout of the bioretention area is determined after site constraints such as location of utilities, underlying soils, existing vegetation, and drainage are considered (EPA, 1999). Sites with loamy sand soils are especially appropriate for bioretention because the excavated soil can be backfilled and used as the planting soil, thus eliminating the cost of importing planting soil.

The use of bioretention may not be feasible given an unstable surrounding soil stratum, soils with clay content greater than 25 percent, a site with slopes greater than 20 percent, and/or a site with mature trees that would be removed during construction of the BMP.

Bioretention can be designed to be off-line or on-line of the existing drainage system (EPA, 1999). The drainage area for a bioretention area should be between 0.1 and 0.4 hectares (0.25 and 1.0 acres). Larger drainage areas may require multiple bioretention areas. Furthermore, the maximum drainage area for a bioretention area is determined by the expected rainfall intensity and runoff rate. Stabilized areas may erode when velocities are greater than 5 feet per second (1.5 meter per second). The designer should determine the potential for erosive conditions at the site.

The size of the bioretention area, which is a function of the drainage area and the runoff generated from the area is sized to capture the water quality volume.

The recommended minimum dimensions of the bioretention area are 15 feet (4.6 meters) wide by 40 feet (12.2 meters) long, where the minimum width allows enough space for a dense, randomly-distributed area of trees and shrubs to become established. Thus replicating a natural forest and creating a microclimate, thereby enabling the bioretention area to tolerate the effects of heat stress, acid rain, runoff pollutants, and insect and disease infestations which landscaped areas in urban settings typically are unable to tolerate. The preferred width is 25 feet (7.6 meters), with a length of twice the width. Essentially, any facilities wider than 20 feet (6.1 meters) should be twice as long as they are wide, which promotes the distribution of flow and decreases the chances of concentrated flow.

In order to provide adequate storage and prevent water from standing for excessive periods of time the ponding depth of the bioretention area should not exceed 6 inches (15 centimeters). Water should not be left to stand for more than 72 hours. A restriction on the type of plants that can be used may be necessary due to some plants' water intolerance. Furthermore, if water is left standing for longer than 72 hours mosquitoes and other insects may start to breed.

The appropriate planting soil should be backfilled into the excavated bioretention area. Planting soils should be sandy loam, loamy sand, or loam texture with a clay content ranging from 10 to 25 percent.

Generally the soil should have infiltration rates greater than 0.5 inches (1.25 centimeters) per hour, which is typical of sandy loams, loamy sands, or loams. The pH of the soil should range between 5.5 and 6.5, where pollutants such as organic nitrogen and phosphorus can be adsorbed by the soil and microbial activity can flourish. Additional requirements for the planting soil include a 1.5 to 3 percent organic content and a maximum 500 ppm concentration of soluble salts.

Soil tests should be performed for every 500 cubic yards (382 cubic meters) of planting soil, with the exception of pH and organic content tests, which are required only once per bioretention area (EPA, 1999). Planting soil should be 4 inches (10.1 centimeters) deeper than the bottom of the largest root ball and 4 feet (1.2 meters) altogether. This depth will provide adequate soil for the plants' root systems to become established, prevent plant damage due to severe wind, and provide adequate moisture capacity. Most sites will require excavation in order to obtain the recommended depth.

Planting soil depths of greater than 4 feet (1.2 meters) may require additional construction practices such as shoring measures (EPA, 1999). Planting soil should be placed in 18 inches or greater lifts and lightly compacted until the desired depth is reached. Since high canopy trees may be destroyed during maintenance the bioretention area should be vegetated to resemble a terrestrial forest community ecosystem that is dominated by understory trees. Three species each of both trees and shrubs are recommended to be planted at a rate of 2500 trees and shrubs per hectare (1000 per acre). For instance, a 15 foot (4.6 meter) by 40 foot (12.2 meter) bioretention area (600 square feet or 55.75 square meters) would require 14 trees and shrubs. The shrub-to-tree ratio should be 2:1 to 3:1.

Trees and shrubs should be planted when conditions are favorable. Vegetation should be watered at the end of each day for fourteen days following its planting. Plant species tolerant of pollutant loads and varying wet and dry conditions should be used in the bioretention area.

The designer should assess aesthetics, site layout, and maintenance requirements when selecting plant species. Adjacent non-native invasive species should be identified and the designer should take measures, such as providing a soil breach to eliminate the threat of these species invading the bioretention area. Regional landscaping manuals should be consulted to ensure that the planting of the bioretention area meets the landscaping requirements established by the local authorities. The designers should evaluate the best placement of vegetation within the bioretention area. Plants should be placed at irregular intervals to replicate a natural forest. Trees should be placed on the perimeter of the area to provide shade and shelter from the wind. Trees and shrubs can be sheltered from damaging flows if they are placed away from the path of the incoming runoff. In cold climates, species that are more tolerant to cold winds, such as evergreens, should be placed in windier areas of the site.

Following placement of the trees and shrubs, the ground cover and/or mulch should be established. Ground cover such as grasses or legumes can be planted at the beginning of the growing season. Mulch should be placed immediately after trees and shrubs are planted. Two to 3 inches (5 to 7.6 cm) of commercially-available fine shredded hardwood mulch or shredded hardwood chips should be applied to the bioretention area to protect from erosion.

Maintenance

The primary maintenance requirement for bioretention areas is that of inspection and repair or replacement of the treatment area's components. Generally, this involves nothing more than the routine periodic maintenance that is required of any landscaped area. Plants that are appropriate for the site, climatic, and watering conditions should be selected for use in the bioretention cell. Appropriately selected plants will aide in reducing fertilizer, pesticide, water, and overall maintenance requirements. Bioretention system components should blend over time through plant and root growth, organic decomposition, and the development of a natural

soil horizon. These biologic and physical processes over time will lengthen the facility's life span and reduce the need for extensive maintenance.

Routine maintenance should include a biannual health evaluation of the trees and shrubs and subsequent removal of any dead or diseased vegetation (EPA, 1999). Diseased vegetation should be treated as needed using preventative and low-toxic measures to the extent possible. BMPs have the potential to create very attractive habitats for mosquitoes and other vectors because of highly organic, often heavily vegetated areas mixed with shallow water. Routine inspections for areas of standing water within the BMP and corrective measures to restore proper infiltration rates are necessary to prevent creating mosquito and other vector habitat. In addition, bioretention BMPs are susceptible to invasion by aggressive plant species such as cattails, which increase the chances of water standing and subsequent vector production if not routinely maintained.

In order to maintain the treatment area's appearance it may be necessary to prune and weed. Furthermore, mulch replacement is suggested when erosion is evident or when the site begins to look unattractive. Specifically, the entire area may require mulch replacement every two to three years, although spot mulching may be sufficient when there are random void areas. Mulch replacement should be done prior to the start of the wet season.

New Jersey's Department of Environmental Protection states in their bioretention systems standards that accumulated sediment and debris removal (especially at the inflow point) will normally be the primary maintenance function. Other potential tasks include replacement of dead vegetation, soil pH regulation, erosion repair at inflow points, mulch replenishment, unclogging the underdrain, and repairing overflow structures. There is also the possibility that the cation exchange capacity of the soils in the cell will be significantly reduced over time. Depending on pollutant loads, soils may need to be replaced within 5-10 years of construction (LID, 2000).

Cost

Construction Cost

Construction cost estimates for a bioretention area are slightly greater than those for the required landscaping for a new development (EPA, 1999). A general rule of thumb (Coffman, 1999) is that residential bioretention areas average about $3 to $4 per square foot, depending on soil conditions and the density and types of plants used. Commercial, industrial and institutional site costs can range between $10 to $40 per square foot, based on the need for control structures, curbing, storm drains and underdrains.

Retrofitting a site typically costs more, averaging $6,500 per bioretention area. The higher costs are attributed to the demolition of existing concrete, asphalt, and existing structures and the replacement of fill material with planting soil. The costs of retrofitting a commercial site in Maryland, Kettering Development, with 15 bioretention areas were estimated at $111,600.

In any bioretention area design, the cost of plants varies substantially and can account for a significant portion of the expenditures. While these cost estimates are slightly greater than those of typical landscaping treatment (due to the increased number of plantings, additional soil excavation, backfill material, use of underdrains etc.), those landscaping expenses that would be required regardless of the bioretention installation should be subtracted when determining the net cost.

Perhaps of most importance, however, the cost savings compared to the use of traditional structural stormwater conveyance systems makes bioretention areas quite attractive financially. For example, the use of bioretention can decrease the cost required for constructing stormwater conveyance systems at a site. A medical office building in Maryland was able to reduce the amount of storm drain pipe that was needed from 800 to 230 feet - a cost savings of $24,000 (PGDER, 1993). And a new residential development spent a total of approximately $100,000 using bioretention cells on each lot instead of nearly $400,000 for the traditional stormwater ponds that were originally planned (Rappahanock,). Also, in residential areas, stormwater management controls become a part of each property owner's landscape, reducing the public burden to maintain large centralized facilities.

Maintenance Cost

The operation and maintenance costs for a bioretention facility will be comparable to those of typical landscaping required for a site. Costs beyond the normal landscaping fees will include the cost for testing the soils and may include costs for a sand bed and planting soil.

ENGINEERED SOLUTIONS

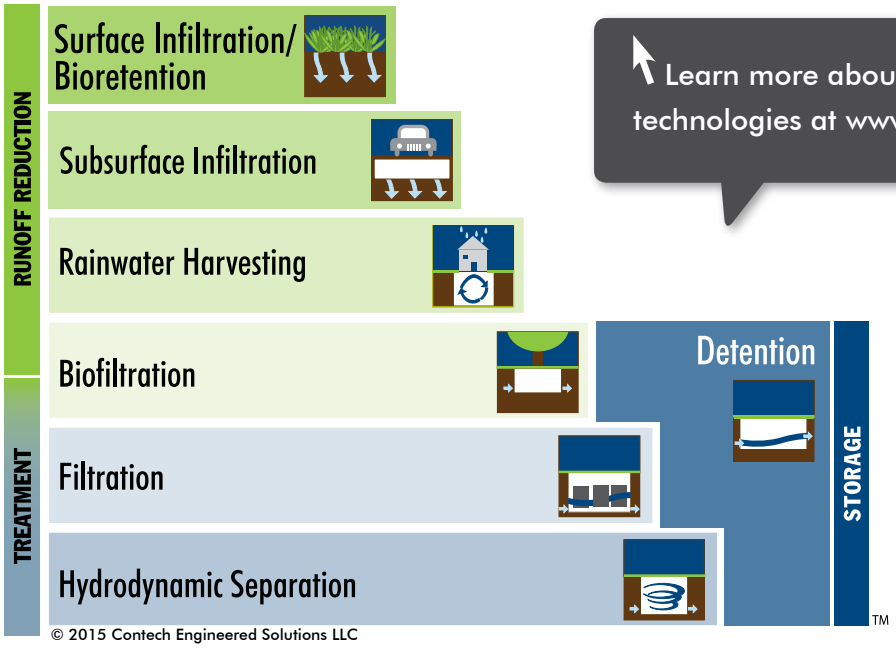
Filterra® Bioretention System

Solutions Guide

Stormwater Solutions from Contech

Selecting the Right Stormwater Solution Just Got Easier...

It's simple to choose the right stormwater solution to achieve your goals with the Contech Stormwater Solutions Staircase. First, select the runoff reduction practices that are most appropriate for your site, paying particular attention to pretreatment needs. If the entire design storm cannot be retained, select a treatment best management practice (BMP) for the balance. Finally, select a detention system to address any outstanding downstream erosion.



Learn more about all of our stormwater technologies at www.ContechES.com/stormwater

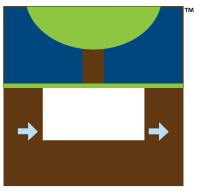
Low Impact Development Site Planner

The Low Impact Development (LID) Site Planner is a free, web-based tool intended to guide you in preliminary selection of the most effective and likely to be approved stormwater control measures that are technically feasible given known site constraints. To utilize this tool, visit www.conteches.com/lidsiteplanner

Benefits of the tool include:

- A fast, easy-to-use tool that follows a Low Impact Development design approach consistent with regulations that prioritize Green Infrastructure.
- Helps minimize the cost and delay of redesigns by prompting users to consider a wide range of common site constraints early in the design process.
- Captures specific site conditions precluding the use of infeasible BMPs.
- Allows flexibility to select flow through treatment controls where runoff reduction is not feasible.
- Provides a summary report with links to design guides, standard details, and specifications for stormwater management approaches that are likely to be feasible and approved on the project.

Bioretention as a Stormwater Management Strategy



Filtration and Biological Treatment in One System

Stormwater management regulations such as Low Impact Development (LID) and Green Infrastructure (GI) have proliferated throughout the United States.

Implementing LID and GI in urban environments is challenging, as they often require a large footprint. That doesn't mean LID/GI is not possible, it just means the solution may take a more engineered form. Contech has addressed this need by developing a unique solution – the Filterra Bioretention System.

What is Filterra?

Filterra is an engineered biofiltration device with components that make it similar to bioretention in pollutant removal and application, but has been optimized for high volume/flow treatment in a compact system. Its small footprint allows Filterra to be used on highly developed sites such as landscaped areas, parking lots, and streetscapes. Filterra is adaptable and can be used alone or in combination with perforated pipes or chambers to optimize runoff reduction.

How The Standard Offline Filterra Systems Works

Stormwater runoff enters the Standard Offline Filterra system through a curb-inlet opening and flows through a specially designed filter media mixture contained in a landscaped modular container. The biofiltration media captures and immobilizes pollutants; some of these pollutants are then decomposed, volatilized and incorporated into the biomass of the Filterra system's micro/macro fauna and flora. Stormwater runoff flows through the media and into an underdrain system at the bottom of the container, where the treated water is discharged. The Standard Offline Filterra system utilizes a downstream catch basin or curb inlet for bypass flows allowing for the shallowest profile and most flexible design of any of the Filterra configurations.

In areas where runoff reduction and infiltration are mandated or desirable, Filterra can be paired with other Contech products such as ChamberMaxx or an Urban Green Rainwater Harvesting system to provide even greater alignment with LID/GI goals.

Filterra® Features & Benefits

- **Regulatory Compliance** – Multiple third-party field tests confirmed Filterra meets regulatory requirements for pollutant removal under TAPE, TARP, and NJCAT testing.
- **Value** – Filterra offers a cost effective stormwater treatment system featuring easy installation and simple maintenance.
- **Aesthetics** – Landscaping enhances the appearance of your site making it more attractive while removing pollutants.
- **Flexible** – Multiple sizes and a variety of configurations available to meet site-specific needs.
- **Versatile** – Filterra is ideal for both new construction and urban retrofits, as well as:
  - » Streetscapes
  - » Urban settings
  - » Parking lots
  - » Roof drains
  - » Highways
- **Easy Installation** – Delivered on-site, ready to lift and place.
- **Activation** – Performed by Contech-certified providers to ensure effective performance from the start.
- **Maintenance** – Simple and safe (no confined space access), and the first year of maintenance is included with the purchase of every system.

Third-party field testing confirmed Filterra meets regulatory requirements for pollutant removal under nationally recognized TAPE, TARP, and NJCAT testing protocols.

Additional Filterra® Configurations

Filterra is offered in multiple configurations to meet site specific needs. These configurations make Filterra a versatile yet effective stormwater BMP with a low life-cycle cost.

Filterra Internal Bypass – Curb

The Filterra Internal Bypass – Curb incorporates a curb inlet treatment chamber and internal high flow bypass in a single structure. This eliminates the need for a separate bypass structure and enables placement on grade or in a "sag" or "sump" condition.

Filterra Internal Bypass – Pipe

The Filterra Internal Bypass – Pipe treats stormwater runoff from rooftops or other sub-grade sources such as area drains. Higher flows bypass the biofiltration treatment system via an overflow/bypass pipe design.

Filterra - Street Tree

The Filterra Street Tree accommodates trees larger than the standard small-medium-sized trees used in standard Filterra units. These larger trees can provide benefits to site landscape designs on canopy cover, tree count, or percentage of green area.

Filterra – Sediment Chamber

The Filterra Sediment Chamber includes a pre-treatment chamber that provides settling for debris and sediment, meeting water quality volume temporary hold requirements in some jurisdictions, and provides a treatment-train feature to a standard Filterra.

Filterra – Recessed Top

The Filterra Recessed Top allows for a seamless integration of Filterra into the landscape design with pavers, mulch, sod, or even architectural concrete.

Filterra® Media – Proven Pollutant Removal

At the heart of the Filterra system is Filterra engineered biofiltration media; a specified gradation of washed aggregate and organic material homogeneously blended under strict quality controlled conditions. Using data from independent, third-party studies including the University of Virginia (TARP), Herrera Environmental Consultants (TAPE), Terraphase Engineering (NJCAT), North Carolina State University (TAPE & TARP) and Geosyntec Consultants, the filter media has been optimized to operate under high flow rates while maintaining pollutant removal performance. Filterra media is tested for hydraulic functionality, fertility, and particle size distribution to ensure uniform performance.

Filterra media also supports a vegetation component consisting of grasses, shrubs, or trees that assist with the adsorption of pollutants with biological uptake/storage and pollutant consumption by microbes within the plant root zone.

Measured Pollutant Removal Performance

(Ranges varying with particle size, pollutant loading and site conditions)

TSS Removal	85%
Phosphorus Removal	70%
Nitrogen Removal	43%
Total Copper Removal	58%
Dissolved Copper Removal	46%
Total Zinc Removal	66%
Dissolved Zinc Removal	58%
Oil & Grease	93%

Information on the pollutant removal efficiency of the filter media/plant media is based on third-party lab and field studies.

Some jurisdictions recognize higher removal rates - see your Contech Stormwater Consultant for details.

Filterra media has been **optimized** to operate under high flow rates while maintaining pollutant removal performance.

Filterra® – Regulatory Approvals

Based on more than 20 years of research and development, testing and field monitoring, Filterra's performance has been recognized by some of the nation's most significant regulatory agencies, including the states of Washington, Virginia, Maryland and New Jersey, the District of Columbia, the Texas Commission on Environmental Quality and the Atlanta (GA) Regional Commission. Highlights regarding these approvals include:

- Granted ESD (Environmental Site Design) status by the state of Maryland Department of the Environment (MDE).
- GULD-approved for ALL pollutants of concern with the state of Washington Department of Ecology (WA-Ecology) with (2) TAPE field tests.
- Third-party nationally recognized field/lab tests completed: (1) TARP, (2) TAPE, (1) NJCAT and (1) NC-DENR.

Filterra® – In the Field

We make it easy! The Filterra system is delivered to the job site with all components except plant and mulch.

Filterra – Installation

- Bioretention system sealed from construction sediment.
- Contractor off-loads top and vault separately.
- Set vault to grade on 6" compacted #57, pipe up, backfill, set top.

Filterra – Activation

- Contractors: Do NOT remove throat plate nor tree grate covers.
- Vegetation selection guidance based on your climate zone.
- Contech-certified providers conduct on-site activation with installation of mulch and plant.

Filterra – Maintenance

- The first year of maintenance is included with every system.
- Maintenance is low-cost, low-tech and simple:
  - » Remove trash, sediment, and mulch.
  - » Replace with a fresh layer of 3" of mulch.
  - » Can be done by landscape contractor.
  - » No confined space entry.

The **first year of maintenance** is **included** with the purchase of every Filterra system.

Acoustical Consultants

Introduction

The Montano de El Dorado Expansion Project (project) consists of the expansion on an existing commercial development located in the southeast quadrant of the White Rock Road and Latrobe Road intersection in El Dorado Hills, California. The existing shopping center encompasses approximately 6 acres and the project proposes the development of approximately 16 acres to the south. The project proposes additional commercial uses, a 4-story hotel, and an outdoor amphitheater. Surrounding land uses include the following: Existing commercial development (Town Center East) to the north; vacant land to the west; and adjacent residential to the east. Figures 1 and 2 show the project site area and site plan, respectively.

This analysis focuses on off-site traffic noise generation, noise generated by on-site commercial-related activity, the proposed amphitheater, events and sales promotions, the proposed SS lift station, construction, and future interior traffic noise levels within rooms of the proposed hotel. On-site commercial related activities that were considered in this analysis consisted of truck circulation and deliveries, waste removal activities, and mechanical equipment associated with air conditioning and potential food cold storage equipment. Specific noise mitigation recommendations are provided in this analysis to mitigate project noise impacts.

Acoustical Fundamentals and Terminology

Noise is often described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard, and are designated as sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second, or hertz. Definitions of acoustical terminology are shown in Appendix A.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals of pressure) as a point of reference, defined as 0 dB. Other sound pressures are then compared to the reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB. Another useful aspect of the decibel scale is that changes in decibel levels correspond closely to human perception of relative loudness.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by filtering the frequency response of a sound level meter by means of the standardized A-weighting network. There is a strong correlation between A-weighted sound levels (expressed as dBA) and community response to noise. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}). The L_{eq} is the foundation of the day/night average noise descriptor, L_{dn}, and shows very good correlation with community response to noise.

The Day-night Average Level (L_{dn}) is based upon the average noise level over a 24-hour day, with a +10 decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment. For this reason, El Dorado County utilizes hourly performance standards for non-transportation noise sources.

Criteria for Acceptable Noise Exposure

El Dorado County General Plan Noise Level Standards

The Noise Element of the El Dorado County General Plan contains policies to ensure that County residents are not subjected to noise beyond acceptable levels. Noise impacts associated with this project would occur if proposed non-transportation noise sources (e.g. rooftop mechanical equipment, parking lot movements, loading dock activities, on-site slow-moving heavy-truck passbys, idling heavy-trucks, heavy-truck refrigeration units, amphitheater activities), exceed County noise standards at the existing residences to the east. Noise impacts associated with this project would also occur if projected future Latrobe Road traffic noise levels exceed County noise standards at the exterior and interior of the proposed hotel within the project site, or if the project would result in a substantial increase in traffic noise levels at existing residences in the immediate project vicinity. The County General Plan Policies which are applicable to these to potential impacts are reproduced below:

Policy 6.5.1.1 Where noise-sensitive land uses are proposed in areas exposed to existing or projected exterior noise levels exceeding the levels specified in Table 1 (GP Table 6-1) or the performance standards of Table 2 (GP Table 6-2), an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

Policy 6.5.1.2 Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table 2 at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

Policy 6.5.1.3 Where noise mitigation measures are required to achieve the standards of Tables 1 and 2, the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers shall be considered a means of achieving the noise standards only after all other practical

design-related noise mitigation measures have been integrated into the project and the noise barriers are not incompatible with the surroundings.

Policy 6.5.1.5 Setbacks shall be the preferred method of noise abatement for residential projects located along U.S. Highway 50. Noise walls shall be discouraged within the foreground viewshed of U.S. Highway 50 and shall be discouraged in favor of less intrusive noise mitigation (e.g., landscaped berms, setbacks) along other high volume roadways.

Policy 6.5.1.7 Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 2 for noise-sensitive uses.

Policy 6.5.1.8 New development of noise sensitive land uses will not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources which exceed the levels specified in Table 1 unless the project design includes effective mitigation measures to reduce exterior noise and noise levels in interior spaces to the levels specified in Table 1.

Policy 6.5.1.9 Noise created by new transportation noise sources, excluding airport expansion but including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table 1 at existing noise sensitive land uses.

Policy 6.5.1.12 When determining the significance of impacts and appropriate mitigation for new development projects, the following criteria shall be taken into consideration:

A. Where existing or projected future traffic noise levels are less than 60 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 5 dBA L_{dn} caused by a new transportation noise source will be considered significant;

B. Where existing or projected future traffic noise levels range between 60 and 65 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 3 dBA L_{dn} caused by a new transportation noise source will be considered significant; and

C. Where existing or projected future traffic noise levels are greater than 65 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 1.5 dBA L_{dn} caused by a new transportation noise will be considered significant.

Policy 6.5.1.13 When determining the significance of impacts and appropriate mitigation to reduce those impacts for new development projects, including ministerial development, the following criteria shall be taken into consideration:

A. In areas in which ambient noise levels are in accordance with the standards in Table 2, increases in ambient noise levels caused by new non-transportation noise sources that exceed 5 dBA shall be considered significant; and

B. In areas in which ambient noise levels are not in accordance with the standards in Table 2, increases in ambient noise levels caused by new non-transportation noise sources that exceed 3 dBA shall be considered significant.

Table 1
Maximum Allowable Noise Exposure for Transportation Noise Sources
(Table 6-1 of El Dorado County General Plan Noise Element)

Land Use	Outdoor Activity Areas[1] Ldn/CNEL, dB	Interior Spaces	
		Ldn/CNEL, dB	Leq, dB[2]
Residential	60[3]	45	--
Transient Lodging	60[3]	45	--
Hospitals, Nursing Homes	60[3]	45	--
Theaters, Auditoriums, Music Halls	--	--	35
Churches, Meeting Halls, Schools	60[3]	--	40
Office Buildings	--	--	45
Libraries, Museums	--	--	45
Playgrounds, Neighborhood Parks	70	--	--

Notes:

1 In Communities and Rural Centers, where the location of outdoor activity areas is not clearly defined, the exterior noise level standard shall be applied to the property line of the receiving land use. For residential uses with front yards facing the identified noise source, an exterior noise level criterion of 65 dB L_{dn} shall be applied at the building facade, in addition to a 60 dB L_{dn} criterion at the outdoor activity area. In Rural Regions, an exterior noise level criterion of 60 dB L_{dn} shall be applied at a 100 foot radius from the residence unless it is within Platted Lands where the underlying land use designation is consistent with Community Region densities in which case the 65 dB L_{dn} may apply. The 100-foot radius applies to properties which are five acres and larger; the balance will fall under the property line requirement.

2 As determined for a typical worst-case hour during periods of use.

3 Where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

Table 2
Noise Level Performance Standards for Noise Sensitive Land Uses Affected by Non-Transportation Sources
(Table 6-2 of El Dorado County General Plan Noise Element)

	Daytime 7 a.m. – 7 p.m.		Evening 7 p.m. – 10 p.m.		Night 10 p.m. – 7 a.m.	
Noise Level Descriptor	Community	Rural	Community	Rural	Community	Rural
Hourly L_{eq}, dB	55	50	50	45	45	40
Maximum Level, dB	70	60	60	55	55	50

Notes:

Each of the noise levels specified above shall be lowered by five dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive tones.

Each of the noise levels specified above shall be lowered by five dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings).

The County can impose noise level standards which are up to 5 dB less than those specified above based upon determination of existing low ambient noise levels in the vicinity of the project site. In Community areas the exterior noise level standard shall be applied to the property line of the receiving property. In Rural Areas the exterior noise level standard shall be applied at a point 100' away from the residence. The above standards shall be measured only on property containing a noise sensitive land use as defined in Objective 6.5.1. This measurement standard may be amended to provide for measurement at the boundary of a recorded noise easement between all effected property owners and approved by the County.

El Dorado County Zoning Ordinance

Chapter 130.37, Noise Standards, of the El Dorado County Zoning Ordinance contains noise level standards that are consistent with those found in the County's General Plan. Therefore, satisfaction of the general plan noise level standards (Tables 1 and 2) would ensure satisfaction with the zoning ordinance noise level standards.

Noise Standards Applied to the Project

Because the project area is within the El Dorado Hills Community, the Table 2 standards which would be applicable to this project would be those under the "Community" heading. In addition, because it is possible that activities associated with development within the Montano de El Dorado project could occur during daytime, evening, and nighttime periods, this assessment addresses all three time periods.

The maximum noise level standard of 55 dB L_{max} at exterior spaces of noise-sensitive land uses shown in Table 2 would ensure that noise levels within those sensitive receptors would be approximately 45 dB L_{max} with windows open and approximately 30 dB L_{max} within those uses with windows in the closed position. Due to the low interior noise levels which would result from satisfaction with the Table 2 nighttime standard, compliance with those standards would adequately address the issue of sleep disturbance within those uses, as subsequent analysis of potential impacts related to sleep disturbance would not be warranted.

Evaluation of Existing Ambient Noise Environment

The California Environmental Quality Act (CEQA) requires that a project's noise impacts be evaluated not only against a locally adopted noise standards but also against existing ambient conditions which exist without the project. More specifically, a project's noise impacts are considered significant if the project would cause local noise standards to be exceeded or if the project would result in a substantial increase in ambient noise levels. As a result, it is necessary to define existing ambient conditions in order to satisfy CEQA requirements.

The ambient noise environment in the immediate project vicinity is defined primarily by noise from White Rock Road and Latrobe Road. Because the project site is located approximately 12 miles east of Mather Airport, aircraft operations associated with that airport, while intermittently audible, do not appreciably affect the ambient noise environment at the project site.

To quantify existing ambient noise levels at the existing residential community located adjacent to the eastern project site boundary, continuous (48-hour) ambient noise surveys were conducted on March 1-2, 2016 at the locations shown in Figure 1. The noise measurement sites were selected to represent the potentially affected sensitive land uses nearest to the project site.

Larson Davis Laboratories (LDL) Model 820 precision integrating sound level meters were used for the ambient surveys. The meters were calibrated before use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 (precision) sound level meters (ANSI S1.4). The results of the continuous measurements are presented in Table 3. Detailed results are shown numerically in Appendix B and graphically in Appendix C.

Please refer to Appendix A for definitions of acoustical terminology used in this report.

The Table 3 and Appendices B & C data indicate that measured ambient noise levels were generally in the range of the County's noise level guidelines identified in Table 2 for both daytime and nighttime hours. As a result, provided the noise generation of the Montano de El Dorado project land uses satisfies the County's Table 2 noise standards at the nearest residences, the CEQA requirement that the project not result in a substantial increase in ambient noise levels would also be satisfied.

Noise Generation Associated with Project Development

Off-Site Traffic Noise Level Increases

Development of the project site will result in increased traffic on the local roadway network. According to the project traffic analysis prepared by Kimley Horn Transportation Consultants, the project is estimated to generate approximately 4,300 new daily trips while the existing shopping center generates approximately 3,800 daily trips.

To calculate the traffic noise generation of the additional traffic which would be generated by the project, the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model was used. Traffic volumes in the form of AM and PM peak hour turning movements were obtained from the project traffic study. To estimate daily segment volumes, the AM and PM peak hour volumes were added and then multiplied by a factor of 5. Other FHWA Model inputs, including heavy truck percentages, day/night distribution of traffic, and vehicle speeds were estimated from BAC file data and posted speed limits. Appendix D contains the traffic noise modeling assumptions. The modeled existing traffic noise levels, with and without the development of the project site, are provided in Table 4. The modeled cumulative (2035) traffic noise levels, with and without the development of the project site, are provided in Table 5.

Inspection of the Table 4 and 5 data indicate that the project-related traffic noise level increases would be less than 0.5 dB on all of the local roadways. According to Policy 6.5.1.12 of the County General Plan, this range of traffic noise level increases would not be considered significant. As a result, noise impacts associated with project-related traffic noise level increases resulting from the project are predicted to be less than significant.

On-Site Truck Circulation Noise Generation

The project proposes the creation of one anchor commercial building, and eight (8) additional smaller commercial buildings. The anchor commercial store includes a dedicated loading dock on the southeast side of the building. That future loading dock area is indicated in Figure 2. At the smaller commercial buildings, the deliveries would likely occur at the front of the buildings, most likely with medium duty trucks and vans. However, a truck route runs along the eastern boundary of the site, which would carry slow-moving truck traffic in close proximity to the existing residences to the east.

Based on BAC file data for similar sized commercial centers, the single event maximum sound level for slow-moving heavy-duty trucks and medium-duty trucks was assumed to be 75 dB and 70 dB L_{max}, respectively, at a reference distance of 50 feet from the passby area. The outdoor activity areas (backyards) of the single-family residences located to the east are approximately 50 feet from the proposed on-site circulation route. At that distance, heavy and medium-duty truck passby levels would be approximately 75 and 70 dB L_{max} respectively.

Because the heavy-duty and medium-duty truck passbys would be of short duration, the Table 2 noise standard which would be most applicable to these sources would be the L_{max} standard. The predicted heavy-duty and medium-duty truck passby levels of 75 dB and 70 dB, respectively, at the nearby single-family residences to the east would exceed the daytime, evening and nighttime noise level standards of 70 dB, 60 dB and 55 dB L_{max}. Therefore, consideration of additional noise mitigation measures would be warranted for this aspect of the project.

Mitigation Requirements Relative to Daytime Noise Level Standard of 70 dB L_{max}

Predicted heavy-duty truck passby noise levels at the backyards of the residences to the east, 50 feet away, would be approximately 75 dB L_{max}. This level exceeds the County's daytime maximum noise level limit of 70 dB L_{max} by 5 dB. With the location of the passby area fixed, the only available noise mitigation measure would be the construction of a solid noise barrier between the truck passby route and the existing residences.

Because only a 5 dB reduction in maximum noise levels would be required during daytime deliveries, this level of attenuation could be achieved through construction of a solid property line noise barrier of 8 feet in height, provided the barrier blocks line of sight to the residential backyards. The barrier would need to be long enough to ensure that sound would not flank around the ends of the barrier into the neighboring backyards and would need to be constructed at the same base elevation as the final grading of the truck route. In areas along the southern end of the site where a retaining wall is proposed adjacent to the truck route at the location of the barrier, the specified 8-foot height refers to the combined height of the retaining wall and barrier, rather than an 8-foot barrier on top of the retaining wall.

Inspection of the project grading plans indicate that the backyards nearest to the truck passby route vary in elevation relative to the project site. On the northern end of the site, residential pads are depressed 5-10 feet relative to the site, while on the southern end residential pads are elevated as much as 25 feet relative to the site. At the elevated southern residences, the combination of shielding provided by the site grading/retaining wall and intervening topography itself would act as a barrier.

BAC calculated that at residential locations along the southern end of the project site, the combination of retaining wall and intervening topography would provide the 5 dB of noise reduction necessary to reduce maximum noise levels to compliance with the County daytime standard of 70 dB L_{max}. The combined noise reduction of the recommended noise barrier and site topography would mitigate daytime truck passby noise levels to a state of compliance with County's daytime noise level standards. No other mitigation measures would be required for the mitigation of truck passby noise levels, provided such activities were limited to daytime hours.

Mitigation Requirements Relative to Evening Noise Level Standard of 60 dB L_{max}

Predicted heavy-duty truck passby noise levels at the backyards of the residences to the east, 50 feet away, would be approximately 75 dB L_{max}. This level exceeds the County's evening maximum noise level limit of 60 dB L_{max} by 15 dB. As mentioned previously, the only available noise mitigation measure would be the construction of a solid noise barrier between the truck passby route and the existing residences. 15 dB of attenuation from a noise barrier (CMU wall) would likely be infeasible.

Because it is unlikely that a solid wall could be constructed tall enough to provide the 15 dB of noise attenuation required to satisfy the evening maximum noise standard, elimination of evening truck traffic along the route on the eastern side of the site would be required.

Mitigation Requirements Relative to Nighttime Noise Level Standard of 55 dB L_{max}

Predicted heavy-duty truck passby noise levels at the backyards of the residences to the east, 50 feet away, would be approximately 75 dB L_{max}. This level exceeds the County's nighttime maximum noise level limit of 55 dB L_{max} by 20 dB. With the location of the passby area fixed at 50 feet, the only available noise mitigation measure would be the construction of a solid noise barrier between the truck passby route and the existing residences. 20 dB of attenuation from a noise barrier (CMU wall) would likely be infeasible.

Because a solid wall could not be constructed tall enough to provide the 20 dB of noise attenuation required to satisfy the nighttime maximum noise standard, elimination of nighttime truck traffic along the route on the eastern side of the site would be required.

Waste Collection Noise Generation

As shown in Figure 2, a waste storage facility is proposed along the truck route located along the eastern side of the site. Waste collection activities would generate noise levels comparable to slow-moving heavy truck traffic. During the actual dumping of the garbage bin, a brief period of increased maximum noise levels would result. However, the construction of the 8-foot tall retaining wall/noise barrier adjacent to the eastern property line near the waste collection area is expected to substantially attenuate the noise generated during garbage collection activities. Nonetheless, to the extent possible, garbage collection activities should be limited to daytime hours.

Loading Dock Noise Generation

The primary noise source associated with the proposed loading dock area, which is identified in Figure 2, is the heavy trucks stopping (air brakes), backing into the loading docks (back-up alarms), and pulling out of the loading docks (revving engines). Once the trucks have backed into the loading dock, they are unloaded from the inside of the store using a fork lift or hand cart, and most of that unloading noise is contained within the building and truck trailer.

BAC file data collected at a commercial loading dock facility indicate that maximum and average loading dock noise generation at a reference distance of 50 feet was 63 dB L_{eq} and 75 dB L_{max}. The distance between the nearest residences and the effective noise center of the proposed

loading dock area is approximately 150 feet. At that distance, and after consideration of the recommended 8-foot tall property line noise barrier, loading dock noise levels are predicted to be approximately 40 dB L_{eq} and 52 dB L_{max} at the nearest residences to the east. The predicted loading dock average noise levels would satisfy the daytime, evening, and nighttime noise level standards of 55 dB L_{eq}, 50 dB L_{eq}, and 45 dB L_{eq}, respectively. Similarly, predicted loading dock maximum noise levels would satisfy the daytime, evening, and nighttime noise level standards of 70 dB L_{max}, 60 dB L_{max}, and 55 dB L_{max}, respectively.

As a result, this analysis concludes that daytime, evening, and nighttime truck deliveries at the loading dock shown in Figure 2 would comply with the applicable El Dorado County daytime, evening, and nighttime noise standards, provided truck circulation does not occur on the truck route on the eastern side of the site during evening and nighttime hours. No other mitigation measures would be required for the mitigation of loading dock noise levels.

Mechanical Equipment Noise Generation

The HVAC systems for maintaining comfortable temperatures within future uses constructed within the project area will likely consist of packaged rooftop air conditioning systems. Such HVAC units, which typically stand about 4-5 feet tall, would be shielded from view of nearby sensitive uses by the building parapets. Such rooftop HVAC units frequently generate a noise level of approximately 45 dB L_{eq} at a reference distance of 100 feet from the building façade, including shielding by the building parapet. The predicted HVAC noise levels would satisfy the El Dorado County daytime, evening and nighttime noise level standards.

If uses involving food cold storage are proposed within the project area, additional mechanical equipment would be required of those uses. That equipment is typically located on the roof of the building, within a mechanical equipment room inside the building, or at ground-level outside the building. If such equipment is proposed on the roof of a future building located adjacent to the residential property line to the east, rather than enclosed within an equipment room, a project-specific analysis will be required to ensure that adequate shielding of food cold storage mechanical equipment is included in the project design.

Construction Noise Levels

During the construction of the project, noise from construction-related activities would add to the noise environment in the immediate project vicinity. Activities involved in construction would generate maximum noise levels, as indicated in Table 6, ranging from 85 to 90 dB at a distance of 50 feet.

Table 6
Typical Construction Equipment Noise

Equipment Description	Maximum Noise Level at 50 feet, dBA

Given the proximity of existing and proposed noise-sensitive land uses to the project site, all construction activities must adhere to the County's requirements with respect to hours of construction. In addition, equipment must have appropriate sound muffling devices, which shall be properly maintained and used at all times such equipment is in operation. Furthermore, the construction contractor shall locate on-site equipment staging areas so as to maximize the distance between construction-related noise sources and noise-sensitive receptors nearest the project construction areas.

Amphitheater Noise Generation

Amphitheater Location and Configuration

The project proposes the construction of an outdoor amphitheater at the location shown in Figure 2. Figure 3 shows a more detailed aerial view of the proposed amphitheater location the relationship of the amphitheater to the nearest residences to the east. Figure 3 also indicates the locations of the 20 nearest existing residences with the greatest potential for exposure to amphitheater-generated sound.

Amphitheater Sound Generation

As with any venue which incorporates sound amplification systems, the sound output of the venue will depend largely on the capacity and amplifier settings of the system. Large concert venues, such as Cal Expo Amphitheater, Vina Robles Amphitheater, and Mid-State Fairgrounds in Paso Robles generate average sound levels on the order of 100 dBA at the sound mixing board which is typically located approximately 100 feet from the stage. However, the proposed Montano de El Dorado amphitheater would only be 70 feet from the rear of the stage to the last seating area, so it is a dramatically smaller venue than those previously mentioned.

Given the size of the proposed venue, the distance from the speakers to the farthest patrons would be approximately 50 feet. At this relatively short distance, considerably lower speaker volume levels would be required to maintain comfortable listening conditions within the seating area. The venue size would be more typical of a wedding reception than a major concert.

BAC has conducted sound level measurements at various small entertainment venues in recent years. Table 7 shows the sound levels measured at each venue.

Table 7
Measured Amplified Music Sound Levels at Various Comparably Sized Venues

Location	Measurement Distance	Measured Levels, dBA	
		Lmax	Leq
Gold Hill Gardens - Placer County, CA	75	76	72
PJ's at Gray's Crossing – Truckee, CA	50	80	75
Sheldon Inn – Elk Grove, CA	85	79	69
Tahoe Donner Resort – Truckee, CA	40	77	75
Fruit Yard – Modesto, CA	100	78	70
Average of all venues at 50 ft. distance.	**50**	**80**	**75**

Notes: All data was collected by BAC staff using calibrated Type 1 sound level meters while amplified music was being played at the various venues. Crowd sizes present at the various venues ranged from approximately 50 to 200 persons. It should be noted that subwoofers were used at each of these locations. Subwoofers generate considerable low-frequency energy (≈100hz +/-) that is subject to lower levels of atmospheric absorption than mid and higher frequencies.

Figure 3
Proposed Amphitheater Location and Orientation Relative to Existing Residences to the East
Montano De El Dorado Project – El Dorado County, California

BOLLARD Acoustical

Note: Green dashed lines indicate locations where line-of-sight between the proposed amphitheater and residences would be interrupted by proposed Building 4.

N

The Table 7 data indicate that, while the amplified music levels varied at each location, the average levels computed to 80 dBA Lmax and 75 dBA L_{eq} at a reference distance of 50 feet from the amplified sound system speakers. Nonetheless, for a more conservative estimate of project sound generation, a reference level of 80 dB Leq was assumed at a 50 foot distance.

Attenuation due to Loud Speaker Directionality

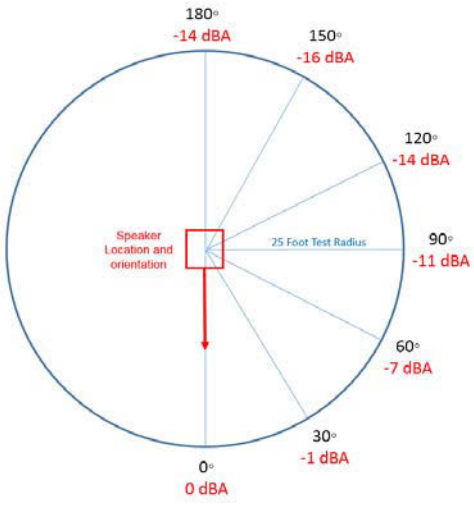
As indicated on Figure 3, the amphitheater orientation is such that loudspeakers which would periodically be used for amplified speech or music would generally face south, parallel to the property line of the residences to the east. As a result of the amphitheater orientation, the nearest residences to the north would have sideline (90 degrees off axis) exposure to the amphitheater, whereas the further residences to the southeast would have more direct exposure (12 degrees off axis).

At low frequencies (i.e. 63 – 125 hertz), loudspeakers are not particularly directional. However, at mid and high frequencies, loudspeaker intensity drops off considerably at off-axis positions, including substantial decreases in sound intensity at positions behind the loudspeaker.

BAC conducted acoustical testing to quantify the decrease in sideline sound levels which can generally be expected for commercial loudspeakers of the type which would be used for a venue of this size. Specifically, BAC placed a Yamaha MSR 400 watt amplified speaker in the center of an open area and conducted sound level testing at equally spaced distances (25 feet from the speaker) and angles (30 degree increments from 0 to 180 degrees), on October 17, 2019. Figure 4a shows a photograph of the test configuration and Figure 4b provides a schematic of the test locations and indicates the decrease in A-weighted sound pressure levels by position.

Figure 4a – Speaker Directionality Test Photo

Figure 4b – Speaker Directionality Test Results



As indicated by Figure 4b, the decrease in sound levels at positions within 30 degrees off-axis of the speaker orientation was negligible (-1 dBA). However, at positions 60 and 90 degrees off axis, the decrease in A-weighted sound pressure levels was measured to be -7 and -11 dBA, respectively.

Figure 3 shows that receivers 1-5 are all located off-axis to the speaker direction. Receiver 1 is approximately 90 degrees off axis whereas receiver 5 is approximately 45 degrees off axis. BAC interpolated the speaker directionality test results indicated above in Figure 4b to develop offsets to amphitheater sound levels at the nearest residences resulting from speaker directionality. Those offsets are presented later in this discussion of potential amphitheater noise impacts at the nearest residences.

Attenuation due to Atmospheric Absorption of Sound in Air

Air absorbs sound energy. The amount of absorption is dependent on the temperature and humidity of the air, as well as the frequency of the sound. Families of curves have been developed which relate these variables to molecular absorption coefficients, frequently expressed in terms of dB per thousand feet. For standard day atmospheric conditions, defined as 59 degrees Fahrenheit and 70% relative humidity, the molecular absorption coefficient at 1000 hertz is 1.5 dB per thousand feet. Molecular absorption is greater at higher frequencies, and reduced at lower frequencies. In addition, for drier conditions, which are common in the El Dorado Hills area, the molecular absorption coefficients generally increase. Similarly, as temperatures increase, molecular absorption coefficients typically increase as well. For a conservative assessment of sound propagation for this evaluation, a single attenuation factor of 1.5 dB per thousand feet of distance from the amphitheater was applied.

Effects of Barriers and Ground Cover

A noise barrier is any impediment which intercepts the path of sound as it travels from source to receiver. Such impediments can be natural, such as a hill or other naturally occurring topographic feature which blocks the receiver's view of the source, vegetative, such as heavy tree cover which similarly blocks the source from view of the receiver, or man-made, such as a solid wall, earthen berm, or building constructed between the noise source and receiver. Regardless of the type of impediment, the physical properties of sound are such that, at the point where the line-of-sight between the source and receiver is interrupted by a barrier, a 5 dB reduction in sound occurs.

The effectiveness of a barrier is a function of the difference in distance sound travels on a straight-line path from source to receiver versus the distance it must travel from source to barrier, then barrier to receiver. This difference is referred to as the "path length difference", and is used to calculate the Fresnel Number. A barrier's effectiveness is a function of the Fresnel number and frequency content of the source. In general, the more acute the angle of the sound path created by the introduction of a barrier, the greater the noise reduction provided by the barrier.

For this project the nearest residences to the proposed amphitheater site will be shielded by intervening topography resulting from the residences being substantially depressed relative to the eastern project property line. Further south on the project site, the adjacent receptors are elevated relative to portions of the project site, thereby reducing the level of natural topographic shielding between the proposed amphitheater and those residences.

As indicated on Figure 3, additional shielding of the amphitheater from view of residences 6 through 16 will result from the construction of Building 4 on the project site. In addition, the presence of vehicles in the parking areas will also provide an additional degree of acoustical shielding in the direction of some of the nearest residences.

Because the project site will be cleared of vegetation and paved, no sound absorption offsets were applied in this analysis for ground cover.

Predicted Amphitheater Sound Levels at Nearest Residences

The assumed reference sound system level of 80 dBA Leq was projected to the nearest residences assuming standard spherical spreading of sound (6 dBA decrease for each doubling of distance from the source). Offsets for speaker directionality were applied as appropriate and shielding offsets resulting from both intervening topography and structures were computed and applied. Table 8 shows the predicted average sound pressure levels at each of the nearest residences to the north of the proposed amphitheater site.

Table 8
Computed Amphitheater Sound Levels at Nearest Residences

Receiver	Distance	Speaker Direction Angle	Speaker Direction Offset	Shielding Offset	Atmospheric Absorption	Predicted Sound Level, Leq dBA

Source: Bollard Acoustical Consultants, Inc. (BAC)

The Table 8 data indicate that predicted amphitheater sound levels would be in the range of 42 to 49 dBA at the nearest residences to the amphitheater site during an amplified music event which generates a reference level of 80 dBA at a distance of 50 feet from the sound system speakers.

Amphitheater Event Simulation

To generally evaluate the propagation of sound from the proposed amphitheater site location in the direction of the nearest residences, BAC conducted an outdoor concert simulation at the location of the proposed amphitheater on August 25, 2017.

Amplified music was generated through Yamaha MSR 400 portable concert speakers and a Yamaha MSR 800 subwoofer at a volume level of 75 dBA measured from a position 50 feet in front of the speakers. While music was being played at this average level, noise measurements were taken at various positions along the eastern property line (shown in Figure 1). Noise measurement equipment met the same specifications as described previously. Appendix E contains photographs of the concert simulation setup.

The simulation utilized a reference music level of 75 dB at a distance of 50 feet from the speakers. The resulting measured noise levels at measurement locations 1 – 4 (shown in Figure 1) are provided below in Table 9, along with the predicted noise levels at these locations and the resulting calculated offsets for topographic shielding and existing ground cover.

Table 9
Measured Amphitheater Simulation Noise Levels
Montano de El Dorado – El Dorado County, California

Location[1]	Distance to Speakers	Predicted Level, dBA[2]	Measured Level, dBA[3]	Offset[4]
Reference	50	75	75	0
1	420	57	50	-7
2	280	60	45	-15
3	210	63	43	-20
4	200	63	47	-16

Notes:
1. Measurement locations shown in Figure 1. All locations were along the eastern property line, representing the nearest residences.
2. Predicted noise level at specified distance, given a reference level of 75 dB at 50 feet, assuming spherical spreading and no topographical shielding.
3. Measured noise level at same specified distance, collected during concert simulation.
4. Noise reduction provided by topographic shielding and existing ground cover. Calculated by subtracting measured level from predicted level.

Source: Bollard Acoustical Consultants, Inc.

The Table 9 data indicate that up to a 20 dB reduction in sound levels resulted from a combination of existing topographic shielding and ground cover at locations along the eastern property line nearest to the proposed amphitheater. Because the project site will be graded and paved, some of this topographic shielding and the majority of the existing ground cover absorption will be removed. However, additional shielding by intervening Building 4 and vehicles in the parking areas would be introduced. The net effect of the shielding which will be removed versus that which will be added is expected to be relatively minor.

Amphitheater Noise Impacts and Mitigation Measures

As noted previously, the Table 8 data indicate that predicted amphitheater sound levels would be in the range of 42 to 49 dBA at the nearest residences to the amphitheater site during an amplified music event which generates a reference level of 80 dBA at a distance of 50 feet from the sound system speakers. The actual sound levels received at the nearest residences to the east will depend largely on the actual sound system output, which is variable. Although the use of 80 dBA Leq at 50 feet is a reasonable assumption for this analysis given the size of this proposed venue, it is possible that actual levels could exceed that reference level at times. Nonetheless, based on the assumed reference level of 80 dBA L_{eq} at 50 feet and the offsets for speaker directionality, shielding, and atmospheric absorption of sound reported in Table 8, the predicted sound levels during an amplified music event would be satisfactory relative to the El Dorado County daytime noise level standard of 50 dBA. However, the County's 45 dBA evening noise level standard could be exceeded at some of the nearest residences and the County's 40 dBA nighttime standard would be exceeded at all of the nearby residences. Because ambient noise conditions currently exceed the County's noise level standards at the property lines of the nearby residences due to traffic on Latrobe Road, sound generated by the amphitheater event will be partially to substantially masked by existing ambient noise, particularly at the southernmost residences which are closest to Latrobe Road and elevated. Nonetheless, because amphitheater sound levels could exceed the County's noise standards, the following specific noise mitigation measures are recommended for the proposed amphitheater portion of this project:

1. Limit all amplified music events to daytime hours until it can be concluded through sound level measurements conducted during the initial events that amplified events could occur during evening hours (7 pm – 10 pm), without causing exceedance of the County's evening noise standards within the neighboring residential properties.

2. Prohibit amplified music events during nighttime hours (10 pm – 7 am).

3. Prohibit the use of subwoofers at this venue during amplified music events. This measure is recommended because low frequency sound dissipates less rapidly with distance and is frequently reported as common source of annoyance at residential uses located in relatively close proximity to venues where amplified music occurs.

Noise Generation of Events and Sales Promotions

Montano de El Dorado proposes different types of events and different marketing justifications for doing those events within the Montano Plaza and at times within the amphitheater. According to project representatives, the most common are (I) special events to attract customers who have a special interest or to generate income from promoters, (i.e. craft shows or farmers markets); (2) community events to generate goodwill and publicity, (i.e. charity bazaar, stage-oriented presentations, etc.) (3) sales promotions to generate retail sales and clearaway merchandise, (i.e. a fall sidewalk sale throughout the plaza with product presentations located at the amphitheater); (4) positioning events to create image, (i.e. grand re-openings, tenant business openings, Chamber of Commerce activities); and (5) seasonal entertainment that may offer ongoing local

music talent in the early evening occasionally in the summer or plays (i.e. El Dorado Music Theater (EDMT), Monday Night at the Movies, etc.).

Noise generated by music events at the proposed amphitheater was evaluated in the previous section and additional analysis of amphitheater-generated noise related to stage presentations, presentations, Summer plays, and Monday night at the movies would all fall under the noise generation levels previously identified for the amphitheater. However, noise would also be generated by crowds at the various locations where these events and promotions would occur.

BAC was provided with a comprehensive list of activities which would occur at the project site throughout the year, the locations where those activities would occur, and the estimated attendance at each of those activities. That list is provided in Table 10. Figure 5 shows the various locations where the events identified in Table 10 would occur.

Figure 5: Locations of Events and Promotions

Table 10
Potential Event Calendar
(Subject to Change)

Month	Event	Where on Site	Attendance Estimate
January	Community Blood Drive at the Amphitheater	Red	100
February	Bridal Fashion Show at the Amphitheater	Red	100
March	Fashion Show at the Amphitheater	Red	100
	Montano Chile Cookoff/plaza wide craft Fair Charity event	Green	200
April	Easter Event/Egg Hunt	Orange	100
	Monday Movie at Montano - Amphitheater	Red	75
	St. Patrick's Day Event	Purple	350
May	Memorial Day Music - Amphitheater	Red	150
	El Dorado Music Theater (EDMT) Play (4 days)	Red	150
	Local Wine Crush & Arts Festival	Green	350
	Monday Movie at Montano - Amphitheater	Red	75
	Amphitheater Music – limited amplification 5:30pm-8:30pm	Red	150
June	Farmers Market 2nd Saturday	Orange	175
	Taste of El Dorado County – Food, Wine, and Crafts	Green	150
	Monday Movie at Montano - Amphitheater	Red	75
	Amphitheater Music – limited amplification 5pm-8pm	Red	150
July	July 4th celebration in coordination with Town Center	Orange	300
	Farmers Market 2nd Saturday	Orange	175
	Amphitheater Music – limited amplification 5:30pm-8:30pm (Saturdays)	Red	150
	Monday Movie at Montano - Amphitheater	Red	75
August	Farmers Market 2nd Saturday	Orange	175
	El Dorado Music Theater (EDMT) Play - Amphitheater	Red	150
	Amphitheater Music – limited amplification 5:30pm-8:30pm (Saturdays)	Red	150
	Perks & Paws Festival to benefit Humane Society	Orange	300
	Monday Movie at Montano - Amphitheater	Red	75
September	9/11 Patriots/Veterans Event	White	150
	Farmers Market 2nd Saturday	Orange	175
	Monday Movie at Montano - Amphitheater	Red	75
	Amphitheater Music – limited amplification 5:30pm-8:30pm (Saturdays)	Red	150

	Craft Brew Tasting & Blue Grass	Green	250
	Monday Movie at Montano – Amphitheater	Red	75
	Classic Car Show	Orange	150
November	Cornish Craft Festival & Merchant Each Saturday (Tgiving to Xmas)	Plaza Wide	250
	Talent Show to benefit Charity Groups	Plaza Wide	150
December	Cornish Craft and Merchant Festival Each Saturday (Tgiving to Xmas)	Plaza Wide	250
	Christmas Special/charity event – Coordinate Santa Sleigh visit	Plaza Wide	150

In order to quantify event-generated crowd noise from the outdoor events and promotions described in Table 10, BAC utilized reference file data for persons speaking in normal and raised voices (normal voice = 57 dB per person at 3 feet, raised voice = 64 dB, and loud voice = 73 dB). Based on the provided information of typical guest's speech sound generation in the outdoor event areas, the analysis concluded that worst-case crowd noise exposure is predicted to range from approximately 33 to 47 dB L_{eq} and 38 to 52 dB L_{max} at the nearby residences, including the noise attenuation provided by the proposed property line noise barrier. Based on the proposed hours of the events and activities, the predicted crowd noise levels are within compliance of the County's daytime and evening noise level standards at the noise-sensitive residences to the east, and no additional noise mitigation measures would be warranted for this aspect of the project.

Future Interior Traffic Noise Levels within Proposed Hotel Rooms

The summarized results in Table 4 included an analysis of future Latrobe Road traffic noise levels. Just south of White Rock Road, future Latrobe Road traffic noise levels were calculated to be 70 dB L_{dn}, 100 feet from the roadway centerline. However, the proposed hotel building façade is located approximately 130 feet from the centerline of Latrobe Road. At that distance, future exterior traffic noise levels at the first-floor (ground level) hotel building façade were calculated to be 68 dB L_{dn}. Due to the reduced ground absorption of sound at elevated location, traffic noise levels at upper-floor facades would be expected to be approximately 3 dB higher, resulting in a predicted traffic noise level at upper-floor facades of 71 dB L_{dn}.

Standard hotel construction (wood siding, STC-27 windows, door weather-stripping, exterior wall insulation, composition plywood roof), results in an exterior to interior noise reduction of at least 25 dB with windows closed and approximately 15 dB with windows open. To achieve compliance with the El Dorado County transient lodging interior noise level standard of 45 dB L_{dn}, exterior-to-interior noise reductions of at least 23 dB and 26 dB would be required of the first-floor and upper-floor facades, respectively. Standard construction practices would, therefore, be adequate for the proposed first-floor rooms in achieving compliance with the County standard of 45 dB L_{dn}. However, at upper-floor rooms, BAC recommends that all windows, from which Latrobe Road can be seen, be upgraded to have a Sound Transmission Class (STC) rating of at least 30. In addition, mechanical ventilation (air conditioning) should be provided within all hotel rooms to allow the occupants to close doors and windows as desired for additional acoustical isolation.

Conclusions and Recommendations

The preceding analysis focused on off-site traffic noise generation, noise generated by on-site commercial-related activity, construction activity noise generation, and future interior traffic noise levels within rooms of the proposed hotel. In order to ensure compliance with the El Dorado County General Plan noise level standards, the following activity-specific mitigation measures are recommended:

On-Site Truck Circulation and Unloading (Loading Dock):

1. A solid noise barrier (e.g. CMU wall) measuring at least 8 feet in height relative to the truck passby route elevation should be constructed at the location shown on Figure 2. The 8 feet in height can be achieved by either a sound wall, a retaining wall, or a combination of the sound wall and retaining wall.

2. Truck circulation on the route along the eastern side of the project site (adjacent to the existing residences; see Figure 2) must be limited to daytime hours (7 am to 7 pm). Even after consideration of the recommended noise barrier, predicted truck passby levels would exceed evening (7 pm to 10 pm) and nighttime (10 pm to 7 am) noise level standards, thereby necessitating the requirement for daytime-only circulation along this route. Evening and nighttime deliveries at the proposed anchor commercial building loading dock (shown in Figure 2) would be permissible, provided delivery trucks use alternate routes during these hours.

Mechanical Equipment:

3. All rooftop HVAC equipment associated with air heating and cooling shall be completely shielded from view of nearby sensitive land uses by the rooftop parapets.

4. An acoustical analysis shall be required for any use where mechanical equipment associated with food cold storage is proposed which would not be completely enclosed within the building.

Project Construction:

5. All construction activities must adhere to the County's requirements with respect to hours of construction.

6. Construction equipment must have appropriate sound muffling devices, which shall be properly maintained and used at all times such equipment is in operation.

7. The construction contractor shall locate on-site equipment staging areas so as to maximize the distance between construction-related noise sources and noise-sensitive receptors nearest the project construction areas.

Amphitheater:

8. Limit all amplified music events to daytime hours until it can be concluded through sound level measurements conducted during the initial events that amplified events could occur during evening hours (7 pm – 10 pm), without causing exceedance of the County's evening noise standards within the neighboring residential properties.

9. Prohibit amplified music events during nighttime hours (10 pm – 7 am).

10. Prohibit the use of subwoofers at this venue during amplified music events.

Hotel – Future Interior Traffic Noise:

11. Standard construction practices (wood siding, STC-27 windows, door weather-stripping, exterior wall insulation, composition plywood roof) would be adequate for the proposed first-floor hotel rooms.

12. All upper-floor hotel rooms with a view of Latrobe Road should be upgraded to an STC rating of 30.

13. Mechanical ventilation (air conditioning) should be provided for all hotel rooms to allow the occupants to close windows as desired to achieve compliance with the applicable interior noise level criteria.

Waste Collection Activities:

14. To the extent practical, waste collection activities should be scheduled during daytime hours.

This concludes BAC's assessment of the Montano de El Dorado Expansion Project. Please contact BAC at (916) 663-0500 or paulb@bacnoise.com if you have any comments or questions regarding this report.

Appendix A

Acoustical Terminology

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
Attenuation	The reduction of an acoustic signal.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.
CNEL	Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.
Frequency	The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.
L_{dn}	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
L_{eq}	Equivalent or energy-averaged sound level.
L_{max}	The highest root-mean-square (RMS) sound level measured over a given period of time.
Loudness	A subjective term for the sensation of the magnitude of sound.
Masking	The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.
Noise	Unwanted sound.
Peak Noise	The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the Maximum level, which is the highest RMS level.
RT_{60}	The time it takes reverberant sound to decay by 60 dB once the source has been removed.
Sabin	The unit of sound absorption. One square foot of material absorbing 100% of incident sound has an absorption of 1 sabin.
SEL	A rating, in decibels, of a discrete event, such as an aircraft flyover or train passby, that compresses the total sound energy of the event into a 1-s time period.
Threshold of Hearing	The lowest sound that can be perceived by the human auditory system, generally considered to be 0 dB for persons with perfect hearing.
Threshold of Pain	Approximately 120 dB above the threshold of hearing.

[3] Based on the following from the Federal Transit Noise and Vibration Impact Assessment, 2006 (pg 12-3).

$L_{eq}(equip) = E.L.+10*\log(U.F.) - 20*\log(D/50) - 10*G*\log(D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects (FTA 2006: pg 6-23); and

D = Distance from source to receiver.

U.S. Department of Transportation
CA/T Construction Spec. 721.560

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.

— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
blasting	109	@	25	80.1	@	230

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
blasting	1.130	@	25	0.197	@	80

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 12-11 of FTA 2006. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

Federal Transit Association (FTA). 2006 (May). Transit Noise and Vibration Impact Assessment. FTA-VA-90-1003-06. Washington, D.C. Available: <http://www.fta.dot.gov/documents/FTA_Noise_and_Vibration_Manual.pdf>. Accessed: September 24, 2010.

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)
Loading Dock Activity Lmax	86.0	@	50	hard	12	5	0.00	70.4	@	300
							0.66			
Generator Leq	78.0	@	50	hard	12	5	0.00	55.0	@	708
Generator Lmax	82.0	@	50	hard	12	5	0.00	70.0	@	199
							0.66			
							0.66			
							0.66			
							0.66			
							0.66			
							0.66			
							0.66			
							0.66			
							0.66			

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 12-3 and 12-4 of FTA 2006.

Computation of the ground factor is based on the equation presentd in Figure 6-23 on pg. 6-23 of FTA 2006, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

EXECUTIVE SUMMARY

This report documents the results of a transportation impact study completed for the Montano de El Dorado retail center (the "proposed project" or "project"). The project represents an expansion of the existing Montano de El Dorado retail center located in the southeast corner of the Latrobe Road intersection with White Rock Road in El Dorado Hills. The purpose of this impact study is to identify potential environmental impacts to transportation facilities as required by the California Environmental Quality Act (CEQA). This study was performed in accordance with the El Dorado County Community Development Agency's *Transportation Impact Study Guidelines*, and the scope of work required by the County.

The existing center is comprised of approximately 41,300-square feet (sf) of commercial uses. The project proposes up to 82,500-sf of additional commercial uses and a 100-room hotel. Existing access to the site will be provided at the existing intersection of the White Rock Road and Post Street. Three additional driveways will serve the site; one existing right-in/right-out driveway along White Rock Road, one new right-in/right-out driveway along Latrobe Road at the south end of the project site, and one new left-in/right-in/right-out driveway along Latrobe Road. The following transportation facilities are included in this evaluation:

Intersections:

1. El Dorado Hills Blvd @ Saratoga Way
2. El Dorado Hills Blvd @ US-50 WB Ramps
3. Latrobe Rd @ US-50 EB Ramps
4. Latrobe Rd @ Town Center Blvd
5. Latrobe Rd @ White Rock Rd
6. Latrobe Rd @ Site Access Dwy (Future)
7. Latrobe Rd @ Golden Foothill Pkwy (North)
8. Latrobe Rd @ Suncast Ln
9. Latrobe Rd @ Golden Foothill Pkwy (South)/Clubview Drive
10. White Rock Rd @ Four Seasons Dr/Stonebriar Dr
11. White Rock Rd @Windfield Way/Town Center Blvd
12. White Rock Rd @ Post St
13. White Rock Rd @ Valley View Pkwy
14. Silva Valley Pkwy @ Tong Road
15. Silva Valley Pkwy @ US-50 WB Ramps
16. Silva Valley Pkwy @ US-50 EB Ramps

Roadway Segments:

1. Latrobe Road, between White Rock Road and Golden Foothill Parkway (North)
2. White Rock Rd, between Latrobe Road and Post Street
3. White Rock Rd, between Post Street and Valley View Parkway

Freeway Facilities:

1. US-50 Mainline
    a. Eastbound, west of El Dorado Hills Boulevard/Latrobe Road
    b. Westbound, west of El Dorado Hills Boulevard/Latrobe Road
    c. Eastbound, between Latrobe Road off-ramp and Latrobe Road on-ramp
    d. Westbound, between El Dorado Hills Blvd off-ramp and El Dorado Hills Blvd on-ramp
    e. Eastbound, east of El Dorado Hills Boulevard/Latrobe Road
    f. Westbound, east of El Dorado Hills Boulevard/Latrobe Road
    g. Eastbound, between Silva Valley Parkway off-ramp and Silva Valley Parkway on-ramp (Near-Term/Cumulative Only)
    h. Westbound, between Silva Valley Parkway off-ramp and Silva Valley Parkway on-ramp (Near-Term/Cumulative Only)

i. Eastbound, east of Silva Valley Parkway (Near-Term/Cumulative Only)
j. Westbound, east of Silva Valley Parkway (Near-Term/Cumulative Only)

2. US-50 Ramps
   k. Eastbound, diverge to Latrobe Road
   l. Eastbound, diverge to El Dorado Hills Boulevard
   m. Eastbound, merge from Latrobe Road
   n. Eastbound, diverge to Silva Valley Parkway (Near-Term/Cumulative Only)
   o. Eastbound, merge from Silva Valley Parkway (Near-Term/Cumulative Only)
   p. Eastbound, merge from Silva Valley Parkway (Cumulative Only)
   q. Westbound, diverge to Silva Valley Parkway (Near-Term/Cumulative Only)
   r. Westbound, merge from Silva Valley Parkway (Cumulative Only)
   s. Westbound, merge from Silva Valley Parkway (Near-Term/Cumulative Only)
   t. Westbound, diverge to El Dorado Hills Boulevard/Latrobe Road
   u. Westbound, merge from El Dorado Hills Boulevard/Latrobe Road

Based on the County's requirements, this transportation impact study was conducted for the study facilities for the following scenarios:

A. Existing Conditions
B. Existing plus Proposed Project Conditions
C. Near-Term (2025) Conditions
D. Near-Term (2025) plus Proposed Project Conditions
E. Cumulative (2035) Conditions
F. Cumulative (2035) plus Proposed Project Conditions

Significant findings of this study include:

- The proposed project is estimated to generate approximately 4,400 new daily trips, with 128 new trips occurring during the AM peak-hour, and 382 new trips occurring during the PM peak-hour.
- The County's Travel Demand Model (TDM) does not account for the project's proposed land uses and, because the County's TDM does not assume the project's employment growth in TAZ 172, the *General Plan's* cumulative traffic analysis cannot serve as the basis for the Cumulative (2035) traffic analysis of the project. As such, Cumulative (2035) conditions are included in this evaluation.
- As defined by the County, the addition of the proposed project to the Existing, Near-Term (2025), and Cumulative (2035) scenarios significantly worsens conditions at multiple study intersections. All of these impacts can be mitigated to be ***less than significant***.

INTRODUCTION

This report documents the results of a transportation impact study completed for the Montano de El Dorado retail center (the "proposed project" or "project"). The project represents an expansion of the existing Montano de El Dorado retail center located in the southeast corner of the Latrobe Road intersection with White Rock Road in El Dorado Hills. The purpose of this impact study is to identify potential environmental impacts to transportation facilities as required by the California Environmental Quality Act (CEQA). This study was performed in accordance with the El Dorado County Community Development Agency's *Transportation Impact Study Guidelines*[1], and the scope of work required by the County[2].

The remaining sections of this report document the proposed project, analysis methodologies, impacts and mitigation, and general study conclusions.

PROJECT DESCRIPTION

The existing center is comprised of approximately 41,300-square feet (sf) of commercial uses. The project proposes up to 82,500-sf of additional commercial uses and a 100-room hotel. Existing access to the site will be provided at the existing intersection of the White Rock Road and Post Street. Three additional driveways will serve the site; one existing right-in/right-out driveway along White Rock Road, one new right-in/right-out driveway along Latrobe Road at the south end of the project site, and one new left-in/right-in/right-out driveway along Latrobe Road. The project location is shown in **Figure 1**, and the proposed project site plan is shown in **Figure 2**. The following transportation facilities are included in this evaluation:

Intersections:

1. El Dorado Hills Blvd @ Saratoga Wy
2. El Dorado Hills Blvd @ US-50 WB Ramps
3. Latrobe Rd @ US-50 EB Ramps
4. Latrobe Rd @ Town Center Blvd
5. Latrobe Rd @ White Rock Rd
6. Latrobe Rd @ Site Access Dwy (Future)
7. Latrobe Rd @ Golden Foothill Pkwy (North)
8. Latrobe Rd @ Suncast Ln
9. Latrobe Rd @ Golden Foothill Pkwy (South)/Clubview Drive
10. White Rock Rd @ Four Seasons Dr/ Stonebriar Dr
11. White Rock Rd @Windfield Wy/ Town Center Blvd
12. White Rock Rd @ Post St
13. White Rock Rd @ Valley View Pkwy
14. Silva Valley Pkwy @ Tong Road
15. Silva Valley Pkwy @ US-50 WB Ramps
16. Silva Valley Pkwy @ US-50 EB Ramps

Figure 3 illustrates the study intersections facilities, existing traffic control, and existing lane configurations.

Roadway Segments:

1. Latrobe Road, between White Rock Road and Golden Foothill Parkway (North)
2. White Rock Rd, between Latrobe Road and Post Street
3. White Rock Rd, between Post Street and Valley View Parkway

The study freeway facilities are depicted in **Figure 4.**

PROJECT AREA ROADWAYS

The following are descriptions of the primary roadways in the vicinity of the project.

US Route 50 (US-50) is an east-west freeway located south of the project site. Generally, US-50 serves all of El Dorado County's major population centers and provides connections to Sacramento County to the west and the State of Nevada to the east. Primary access to the project site from US-50 is provided at the El Dorado Hills Boulevard/Latrobe Road interchange. Within the general project area, US-50 currently serves approximately 90,000 vehicles per day[3] (vpd) west of El Dorado Hills Boulevard/Latrobe Road.

El Dorado Hills Boulevard is a north-south arterial roadway that provides a primary connection to US-50 for western El Dorado County. South of US-50, El Dorado Hills Boulevard becomes **Latrobe Road**. North of the US-50 interchange area, this roadway carries approximately 30,000 vpd[4] with three through lanes in each direction. South of the interchange this roadway carries approximately 29,700 vpd[4] also with three travel lanes in each direction.

White Rock Road is an east-west arterial roadway that parallels US-50 to the south, connecting Rancho Cordova on the west with Latrobe Road in El Dorado County on the east. White Rock Road, which becomes **Silva Valley Parkway** at US-50, accommodates approximately 10,500 vpd[4] in the vicinity of Latrobe Road.

ASSESSMENT OF PROPOSED PROJECT

Proposed Project Trip Generation and Assignment

The number of trips anticipated to be generated by the proposed project was derived using data included in *Trip Generation, 9th Edition,* published by the Institute of Transportation Engineers (ITE). The anticipated ITE trip generation characteristics for the proposed project are depicted in Table 1.

Table 1 – Proposed Project ITE Trip Generation

Land Use (ITE Code)	Size (ksf / # rooms)	Daily Trips	AM Peak-Hour					PM Peak-Hour				
			Total Trips	IN		OUT		Total Trips	IN		OUT	
				%	Trips	%	Trips		%	Trips	%	Trips
Shopping Center (820) - Existing	41.3	3,824	91	62%	56	38%	35	331	48%	159	52%	172
Existing Total External Trips:		*3,824*	*91*		*56*		*35*	*331*		*159*		*172*
Shopping Center (820) - Proposed+	123.8	7,802	178	62%	110	38%	68	691	48%	332	52%	359
Hotel (310) - Proposed	100	818	53	59%	31	41%	22	60	51%	31	49%	29
Proposed Total External Trips:		*8,620*	*231*		*141*		*90*	*751*		*363*		*388*
Internal Trip Reduction	*5%*	*-431*	*-12*		*-7*		*-4*	*-38*		*-18*		*-19*
Net New External Trips:		***4,365***	***128***		***78***		***50***	***382***		***186***		***197***

Source: *Trip Generation, 9th Edition*, ITE.
+ Proposed Shopping Center is the total project, Existing (41.3-ksf) plus Proposed (82.5-ksf).

As shown in Table 1, the proposed project is estimated to generate approximately 4,400 new daily trips, with 128 new trips occurring during the AM peak-hour, and 382 new trips occurring during the PM peak-hour. It should be noted that, although the project hotel component is specifically identified as being business focused, based on County direction trip generation characteristics for a general hotel use were used in this analysis due to the sample size limitations associated with ITE's Business Hotel (312) land use.

The El Dorado County Travel Demand Model (TDM), in conjunction with detailed Geographic Information System (GIS) analyses of its dataset, was used both as the basis to establish the relative assignment of proposed project trips, and to establish background traffic estimates for analysis scenarios (additional discussion on the specific application of the TDM can be found within each scenario's discussion section). The GIS analysis was specifically included during the relative trip assignment analysis to improve the accuracy of the distribution of trips related to the business hotel as this land use is not an explicit land use type in the TDM.

While the County originally provided the most recent iteration of the County's model at the onset of the project[5], subsequent coordination with the County resulted in additional revisions to that model for use in this study[6]. The project trip distribution percentages that resulted from analyses completed for this study are provided in Figure 5 (existing scenarios) and Figure 6 (2025 and 2035 scenarios).

TRANSPORTATION IMPACT STUDY METHODOLOGY

This transportation impact study was performed in accordance with the County's transportation impact study guidelines[1].

Level of Service Definitions

Analysis of transportation facility significant environmental impacts is based on the concept of Level of Service (LOS). The LOS of a facility is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. Levels of Service for this study were determined using methods defined in the *Highway Capacity Manual (HCM) 2010*.

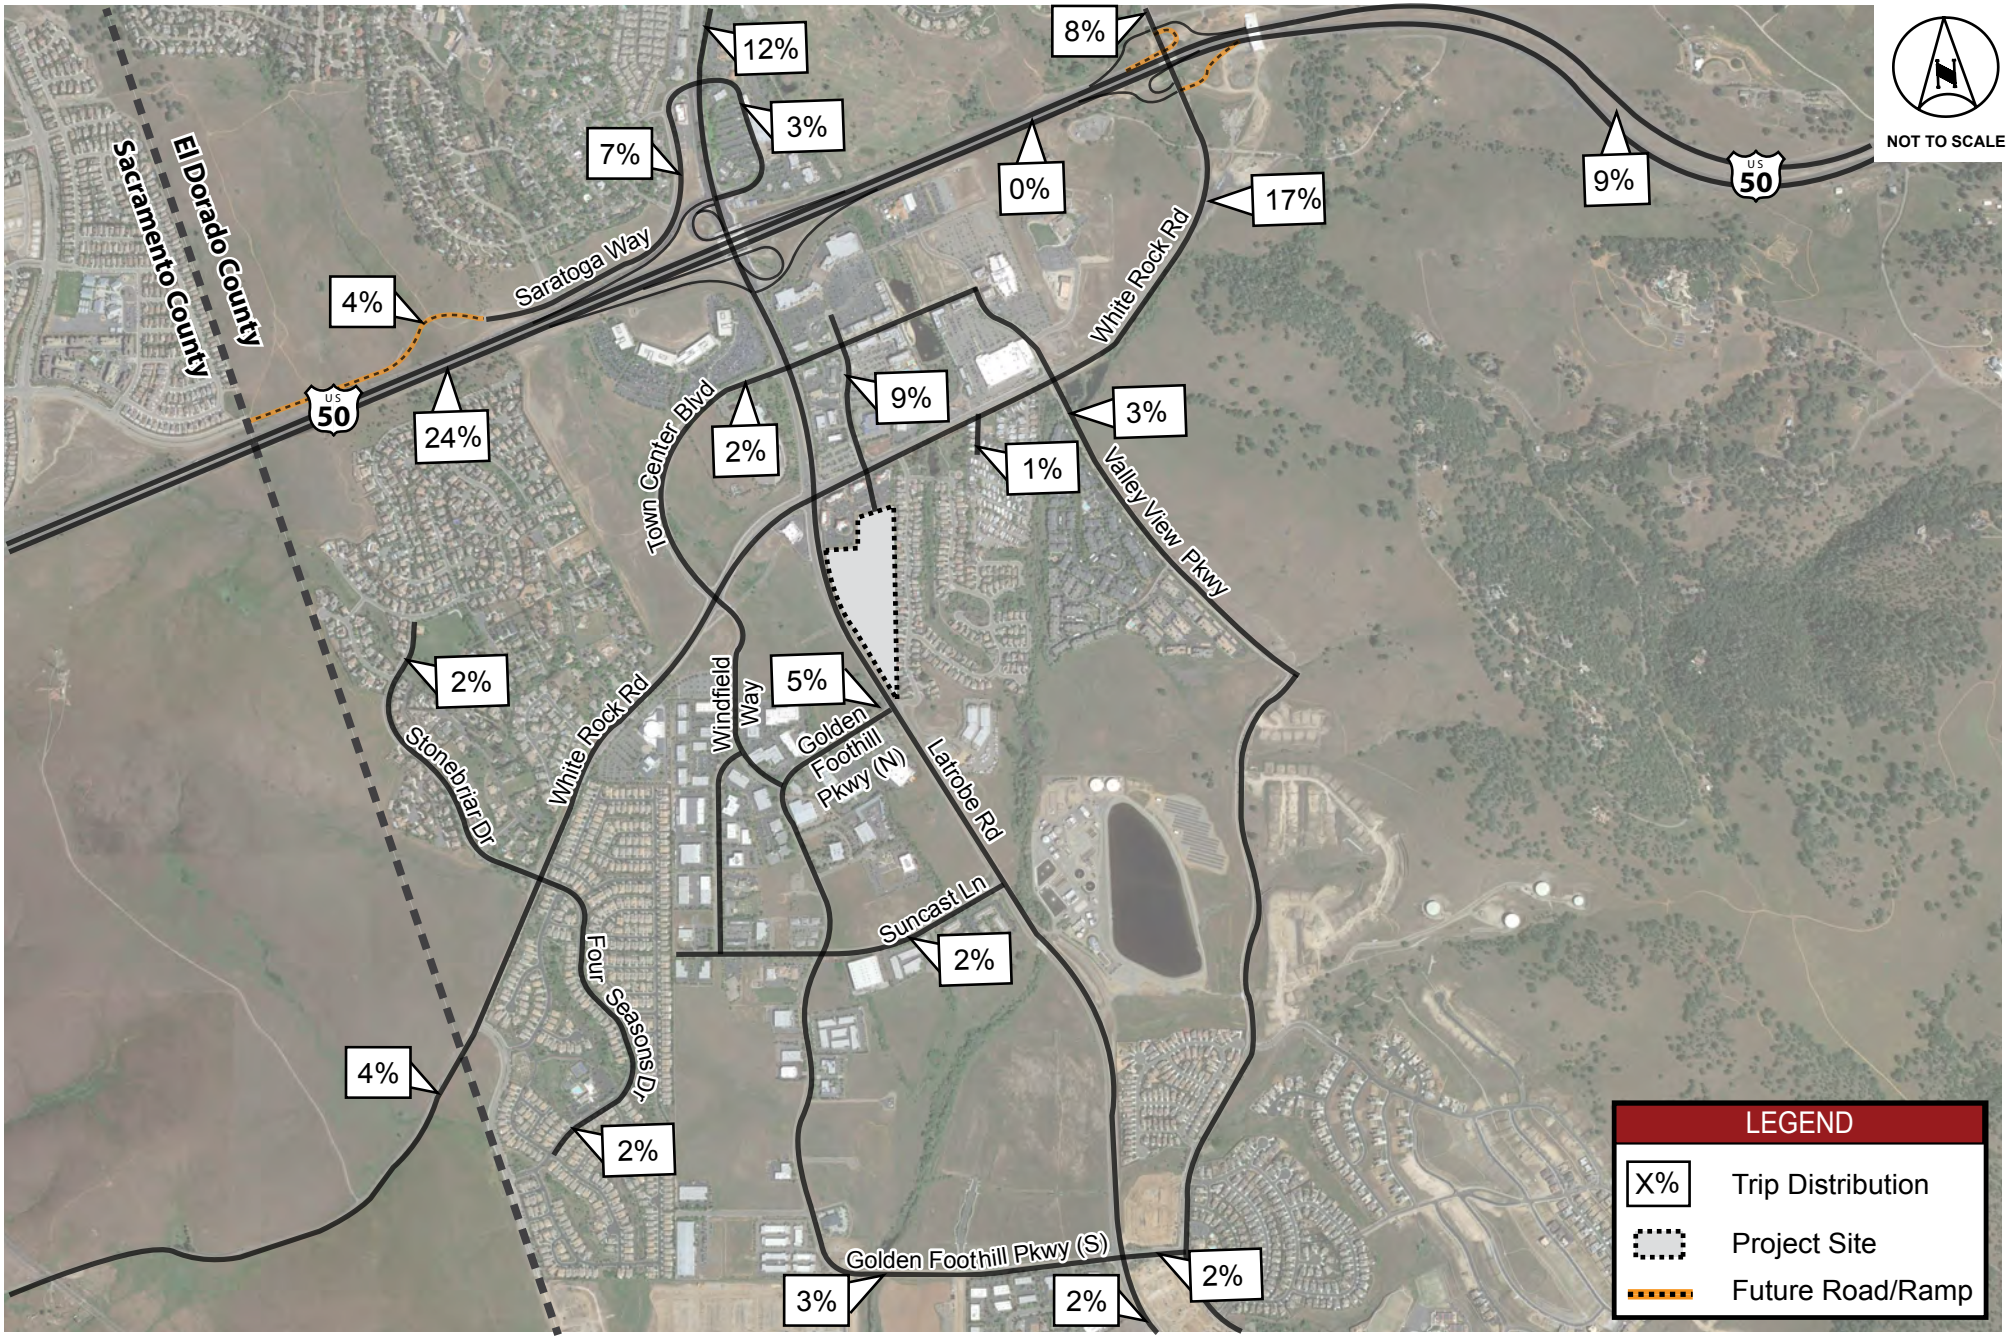
Figure 6
Near Term (2025) Proposed Project Trip Distribution



Kimley»Horn

Figure 7
Cumulative (2035) Proposed Project Trip Distribution

Intersection Analysis

The HCM includes procedures for analyzing side-street stop controlled (SSSC), all-way stop controlled (AWSC), and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for each minor street approach movement. Conversely, the AWSC and signalized intersection procedures define LOS as a function of average control delay for the intersection as a whole. Table 2 presents intersection LOS definitions as defined in the HCM.

Table 2 – Intersection Level of Service Criteria

Level of Service (LOS)	Un-Signalized	Signalized
	Average Control Delay* (sec/veh)	Average Control Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 – 15	> 10 – 20
C	> 15 – 25	> 20 – 35
D	> 25 – 35	> 35 – 55
E	> 35 – 50	> 55 – 80
F	> 50	> 80

Source: Highway Capacity Manual, 2010
* Applied to the worst lane/lane group(s) for SSSC

Due to the close spacing of the El Dorado Hills Boulevard/Latrobe Road intersections in the vicinity of US-50 and along White Rock Road, LOS for Intersections #1-#7 and Intersections #12-13 was determined using the SimTraffic® micro-simulation analysis software. The existing conditions SimTraffic® models were originally provided by the County for use in this study[7]. These models were validated based on field observations of traffic volumes, driver behavior, lane utilization, and maximum vehicle queue lengths. As a result of these observations, adjustments were incorporated that improve the accuracy of the vehicles' behavior as they position for downstream turns. SimTraffic® measures of effectiveness are compared against the HCM intersection delay thresholds to equate SimTraffic® results to HCM LOS. For this simulation effort, a seed time of 10 minutes was used and 10 runs were averaged to obtain the results. LOS for the remaining study intersections was determined using the Synchro® traffic analysis software.

Roadway Segment Analysis

The HCM also includes procedures for analyzing multi-lane and two-lane roadway segments. The Latrobe Road study roadway segment is a multi-lane roadway. The study segments along White Rock Road are either a Class III two-lane or a multi-lane roadway, depending on the location and analysis scenario. For multilane roadways segments, LOS is determined based on the density of the traffic stream. For two-lane highways, the LOS calculation is dependent on the class of the roadway. Class I two-lane highways are highways generally have high speeds, Class II two-lane highways are lower speed highways that typically serve scenic routes or areas of rugged terrain, and Class III two-lane highways typically serve moderately developed areas with higher densities of local traffic and access. Specifically, for Class III highways, the percent of free-flow speed, which is the measure representing the ability of vehicles to travel at the posted speed limit, is used to determine LOS. The LOS criteria for multi-lane and two-lane roadway segments are shown in Table 3 and Table 4, respectively.

[7] Email from Natalie Porter, El Dorado County Community Development Agency, October 24, 2014.

Table 3 – Multi-Lane Roadway Segment Level of Service Criteria

Level of Service (LOS)	Free Flow Speed (mph)	Density (pc/mi/ln)
A	All	> 0 – 11
B	All	> 11 – 18
C	All	> 18 – 26
D	All	> 26 – 35
E	60 55 50 45	> 35 – 40 > 35 – 41 > 35 – 43 > 35 – 45
F (demand exceeds capacity)	60 55 50 45	> 40 > 41 > 43 > 45

Freeway Facility Analysis

Caltrans' traffic study guidelines[8] specify the use of vehicle density (passenger cars/mile/lane) as the appropriate measure of effectiveness for freeway facilities. The LOS criteria for basic freeway segments and freeway merge/diverge segments are summarized in Table 5. We understand that Caltrans District 3 prefers weaving sections to be analyzed using the Leisch Method[9]. As such, the freeway weaving sections in this study are evaluated using this methodology.

Table 5 – Freeway Facility Level of Service Criteria

Level of Service (LOS)	Basic Segments Density (pc/mi/ln)	Merge/Diverge Segments Density (pc/mi/ln)
A	≤ 11	≤ 10
B	> 11 – 18	> 10 – 20
C	> 18 – 26	> 20 – 28
D	> 26 – 35	> 28 – 35
E	> 35 – 45	> 35
F*	> 45*	*

Land Use Consistency and Analysis Scenarios

The current iteration of the County's TDM was used to assist in determining the proposed project's consistency with the County's growth assumptions for Traffic Analysis Zone (TAZ) 172. It was determined that the County's TDM includes a total of 140 employees within the subject TAZ for the existing year (2010). There is nominal growth depicted in the County's future year (2035) land use (from 140 to 158 employees), although this minor increase was confirmed to only account for the two commercial buildings that were recently constructed along White Rock Road[10]. As such, the TDM does not account for the project's proposed land uses and, because the County's TDM does not assume the project's employment growth in TAZ 172, the *General Plan's* cumulative traffic analysis cannot serve as the basis for the cumulative (2035) traffic analysis of the project. As such, Cumulative (2035) conditions (with and without the proposed project) are included in this evaluation. Accordingly, this LOS analysis was conducted for the study facilities for the following scenarios:

A. Existing Conditions
B. Existing plus Proposed Project Conditions
C. Near-Term (2025) Conditions
D. Near-Term (2025) plus Proposed Project Conditions
E. Cumulative (2035) Conditions
F. Cumulative (2035) plus Proposed Project Conditions

EXISTING CONDITIONS

New weekday AM and PM peak-period intersection turning movement traffic counts were conducted in November 2015 for study intersections #7-#11, #13-#14. These counts were conducted between the hours of 6:30 a.m. and 9:30 a.m., and 4:00 p.m. and 7:00 p.m. Of the other nine study intersections, one does not exist today (#6) and additional new weekday AM and PM peak-period intersection turning movement traffic counts were conducted in March 2017 for study intersections #1-#5, and #12. These counts were conducted between the hours of 6:00 a.m. and 9:00 a.m., and 4:00 a.m. and 7:00 p.m. Intersection turning movement traffic volumes for the US-50 westbound and eastbound ramps at Silva Valley Parkway (intersections #15 and #16, respectively) were collected in December 2016[11]. Freeway mainline volumes were obtained from Caltrans' Performance Measurement System[12] (PeMS) using data from March 2015 and October 2015. When combined with the aforementioned recent study, ramp terminal intersection turning movements, weaving segments, and merge/diverge sections were also able to be evaluated.

Existing peak-hour turn movement volumes are presented in Figure 8, and the traffic count data sheets are provided in Appendix A. Analysis worksheets for this scenario are provided in Appendix B.

Intersections

Table 6 presents the intersection operating conditions for this analysis scenario. As indicated in Table 6, the study intersections operate from LOS A to LOS F.

EXISTING PLUS PROPOSED PROJECT CONDITIONS

The number of trips estimated to be generated by the proposed project were determined using the ITE *Trip Generation Manual* and were then assigned to the surrounding transportation network based on the results of a select link analysis completed using a version the El Dorado County TDM prepared specifically for this scenario. Background traffic estimates were developed in accordance with the methods previously described in the Land Use Consistency and Analysis Scenarios section of this report. Using these volumes, levels of service were determined at the study facilities. Existing plus Proposed Project peak-hour turn movement volumes are presented in Figure 9. Analysis worksheets for this scenario are provided in Appendix C.

Intersections

Table 9 presents the intersection operating conditions for this analysis scenario. As indicated in Table 9, the study intersections operate from LOS A to LOS F.

NEAR-TERM (2025) CONDITIONS

Based on the availability of model data and as directed by the County, traffic volume estimates for the Near-Term (2025) Condition were determined by interpolating select El Dorado County TDM 2010 and 2035 analysis results. Specifically, these volumes were achieved by estimating turn movements using 2010 and 2035 land use scenarios and then conducting a straight-line analysis to establish year 2025 turn movement estimates. The difference between the resulting 2025 traffic estimate and the 2010 model results (the growth) was then added to Existing traffic volumes to establish base Near-Term (2025) traffic estimates for this study. In addition, the John Adams Academy is assumed to be developed under Near-Term (2025) conditions. As such, John Adams Academy project trips[13] were added to Near-Term (2025) "no-project" conditions. Near-Term (2025) lane geometries and peak-hour turning movement volumes are presented in Figure 10 and Figure 11, respectively. Analysis worksheets for this scenario are provided in Appendix D.

Intersections

Table 12 presents the intersection operating conditions for this analysis scenario. As indicated in Table 12, the study intersections operate from LOS A to LOS F.

Roadway Segments

Table 13 presents the roadway segment operating conditions for this analysis scenario. As indicated in Table 13, the study roadway segments operate from LOS A to LOS E.

Freeway Facilities

Table 14 presents the freeway facility operating conditions for this analysis scenario. As indicated in Table 14, the freeway facilities operate from LOS A to LOS E.

NEAR-TERM (2025) PLUS PROPOSED PROJECT CONDITIONS

The number of trips estimated to be generated by the proposed project were determined using the ITE *Trip Generation Manual* and were then assigned to the surrounding transportation network based on the results of a select link analysis completed using a version of the El Dorado County TDM prepared specifically for this scenario (based on the method outlined in the prior section). Background traffic estimates were developed in accordance with the methods previously described in the Land Use Consistency and Analysis Scenarios section of this report.

Consistent with other project analysis completed within the County, for the Near-Term (2025) and 2035 scenarios which include project conditions, analyses were prepared to include the difference between growth previously forecast for the project area and the planned project (to avoid double counting planned growth). Using these volumes, levels of service were determined at the study facilities. Near-Term (2025) plus Proposed Project peak-hour turn movement volumes are presented in Figure 12. Analysis worksheets for this scenario are provided in Appendix E.

Intersections

Table 15 presents the intersection operating conditions for this analysis scenario. As indicated in Table 15, the study intersections operate from LOS A to LOS F.

			WB	B	15		
		PM	EB	B	16.2		
			WB	B	12.2		
	White Rock Road, Post to Valley View	AM	EB	E		64.2	0.30
			WB	E		60.7	0.80
		PM	EB	E		55.8	0.79
			WB	E		56.5	0.56

Notes:
D = Density, PFFS = Percent Free-Flow Speed, v/c = Volume to Capacity

Freeway Facilities

Table 17 presents the freeway facility operating conditions for this analysis scenario. As indicated in Table 17, the freeway facilities operate from LOS A to LOS E.

CUMULATIVE (2035) CONDITIONS

As described in the Land Use Consistency and Analysis Scenarios section of this report, future traffic estimates were prepared in consideration of both previous project analyses and the provision of a new TDM release. Analyses completed specifically considered the inclusion of the following projects:

- Saratoga Estates
- Bass Lake Hills Specific Plan
- Carson Creek Specific Plan
- Promontory
- Ridgeview
- San Stino Residential
- Serrano
- Valley View Specific Plan
- Central El Dorado Hills Specific Plan
- Village of Marble Valley Specific Plan
- Lime Rock Specific Plan
- Spanos Apartments

In addition, the John Adams Academy is assumed to be developed under Cumulative (2035) conditions. As such, John Adams Academy project trips[14] were added to Cumulative (2035) "no-project" conditions.

Additionally, the following specific capital improvement projects in the immediate vicinity of the project site are anticipated to be completed prior to year 2035 and are included in this scenario:

- Saratoga Way (4-Lane) Extension
- El Dorado Hills Boulevard @ Saratoga Way Intersection Improvements
- US-50/Silva Valley Parkway Interchange (Phase 2)
- US-50/Empire Ranch Road Interchange
- Wilson Extension

The difference between the resulting 2035 traffic estimate and the 2010 baseline model results (the growth) was then added to Existing traffic volumes to establish Cumulative (2035) traffic estimates for this study.

[14] *John Adams Academy Transportation Impact Study,* El Dorado Hills, California, Kimley-Horn and Associates, March 29, 2018.

CUMULATIVE (2035) PLUS PROPOSED PROJECT CONDITIONS

The number of trips estimated to be generated by the proposed project were determined using the ITE *Trip Generation Manual* and were then assigned to the surrounding transportation network based on the results of a select link analysis completed using a version of the El Dorado County TDM prepared specifically for this scenario (based on the method outlined in the prior section). Likewise, background traffic estimates were developed based on the results of analysis completed using a version of the County's TDM prepared specifically for this scenario (refer to prior section for a discussion on the method).

Consistent with other project analysis completed within the County, for the Near-Term (2025) and 2035 scenarios which include project conditions, analyses were prepared to include the difference between growth previously forecast for the project area and the planned project (to avoid double counting planned growth).

Cumulative (2035) plus Proposed Project peak-hour turn movement volumes are presented in Figure 15. Analysis worksheets for this scenario are provided in Appendix G.

Intersections
Table 21 presents the intersection operating conditions for this analysis scenario. As indicated in Table 21, the study intersections operate from LOS A to LOS F.

Roadway Segments
Table 22 presents the roadway segment operating conditions for this analysis scenario. As indicated in Table 22, the study roadway segments operate at LOS A or LOS B.

Freeway Facilities
Table 23 presents the freeway facility operating conditions for this analysis scenario. As indicated in Table 23, the freeway facilities operate from LOS A to LOS D.

IMPACTS AND MITIGATION

Standards of Significance

Project impacts were determined by comparing conditions with the proposed project to those without the project. Impacts for intersections are created when traffic from the proposed project forces the LOS to fall below a specific threshold. The County's standards[15] specify the following:

> "*Level of Service (LOS) for County-maintained roads and state highways within the unincorporated areas of the county shall not be worse than LOS E in the Community Regions or LOS D in the Rural Centers and Rural Regions…"* (El Dorado County General Plan Policy TC-Xd[16]) The study facilities are located within the El Dorado Hills Community Region.
>
> If a project causes the peak hour LOS or volume/capacity ratio on a county road or state highway that would otherwise meet the County standards (without the project) to exceed the values listed in the above text (El Dorado County General Plan Policy TC-Xd[16]), then the impact shall be considered significant.
>
> If any county road or state highway fails to meet the above listed county standards (El Dorado County General Plan Policy TC-Xd[16]) for peak hour LOS or volume/capacity ratios without the proposed project, and the project will worsen conditions on the road or highway, then the impact shall be considered significant. The term, worsen is defined for the purpose of this paragraph according to General Plan Policy TC-Xe[16] as follows:
>
> "*A. A 2 percent increase in traffic during the a.m. peak hour, p.m. peak hour, or daily, or*
> *B. The addition of 100 or more daily trips, or*
> *C. The addition of 10 or more trips during the a.m. peak hour or the p.m. peak hour*"

The Caltrans District 3 standard of significance was applied to intersections at the US-50 interchange with El Dorado Hills Boulevard/Latrobe Road. Caltrans has established a LOS E threshold for the peak 15 minutes for signalized intersections outside "high speed areas." The US-50 interchange ramp intersections with El Dorado Hills Boulevard/Latrobe Road are not considered to be located in high speed areas, therefore, the LOS E threshold for the peak 15 minutes applies to these facilities.

[16] *El Dorado County General Plan, Transportation and Circulation Element*, July 2004.

Impacts and Mitigation

Existing plus Proposed Project Conditions

As reflected in Table 9, Table 10, and Table 11, the addition of the proposed project results in one (1) significant impact. The following is a discussion of the impacts and their associated mitigations. Analysis worksheets for this scenario are provided in Appendix H.

Impacts:

Intersections

I1. Intersection #9, Latrobe Road @ Golden Foothill Parkway (S)

As shown in Table 9, this intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. ***This is a significant impact.***

Mitigations:

Intersections

M1. Intersection #9, Latrobe Road @ Golden Foothill Parkway (S)

The significant impact at this intersection during the PM peak-hour can be mitigated changing the lane configuration of the eastbound and westbound intersection approaches. The revised lane configuration consists of the following: Eastbound (Left, Shared Left/Through/Right), and Westbound (Right, Shared Left/Through/Right). This mitigation involves minor striping changes and the addition of signal mast arm lane designation signs. The John Adams Academy project is responsible for, among other things, the lane designation mitigation described above. If constructed by others or added to the 20-year CIP prior to development levels in the project site that would require this mitigation, payment of traffic impact mitigation fees would satisfy the project's fair share obligation towards this improvement. If not constructed by others, the applicant would be responsible for implementing this improvement consistent with General Plan Goal TC-X and supporting Policy TC-Xf to ensure that transportation improvements are implemented concurrent with approved development. If constructed by the applicant, the applicant may be eligible for reimbursement through the County's traffic impact mitigation fee program. The implementation of this mitigation results in acceptable LOS C in the AM and LOS D in the PM peak-hour (Table 24). With this improvement, this impact would be ***less than significant.***

Table 24 – Intersection Levels of Service – Existing plus Proposed Project Mitigated Conditions

ID	Intersection	Control	Peak Hour	Existing plus Proposed Project		Existing plus Proposed Project (Mitigated)	
				Delay (sec)	LOS	Delay (sec)	LOS
9	Latrobe Rd @ Golden Foothill Pkwy (S)	Signal	AM	24.2	C	31.2	C
			PM	**108.2**	**F**	42.7	D

Notes:

Bold represents unacceptable operations. Shaded represents significant impact.

Near-Term (2025) plus Proposed Project Conditions

As reflected in Table 15, Table 16, and Table 17, the addition of the proposed project results in two (2) significant impacts. The following is a discussion of the impact and its associated mitigation. Analysis worksheets for this scenario are provided in Appendix H.

Impacts:

Intersections

I2. Intersection #4, Latrobe Road @ Town Center Boulevard

As shown in Table 15, this intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. ***This is a significant impact.***

I3. Intersection #5, Latrobe Road @ White Rock Road

As shown in Table 15, this intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. ***This is a significant impact.***

Mitigation:

Intersections

M2. Intersection #4, Latrobe Road @ Town Center Boulevard

The significant impact at this intersection can be mitigated by optimization of the Latrobe Road coordinated signal system, along with the following improvements: the restriping of the westbound Town Center Boulevard approach to include one left-through lane, and two right-turn lanes, with a permitted-overlap phase for the westbound right-turns. The El Dorado Hills Town Center Apartments project is responsible for, among other things, the lane designation and signal phasing mitigations described above. If constructed by others or added to the 20-year CIP prior to development levels in the project site that would require this mitigation, payment of traffic impact mitigation fees would satisfy the project's fair share obligation towards this improvement. If not constructed by others, the applicant would be responsible for implementing this improvement consistent with General Plan Goal TC-X and supporting Policy TC-Xf to ensure that transportation improvements are implemented concurrent with approved development. If constructed by the applicant, the applicant may be eligible for reimbursement through the County's traffic impact mitigation fee program.

As shown in Table 25, this mitigation measure results in the intersection operating at LOS C during the AM and LOS E during the PM peak-hour. Therefore, ***this impact is less than significant***. In addition, the project may contribute its proportionate share to the County Department of Transportation's Intelligent Transportation System (ITS) program for the El Dorado Hills area, which is currently under development. If a signal at the project driveway were to be approved, fiber optic signal interconnect and conduit installation are required to provide coordinated signal operations. (Note: The Latrobe Road and Town Center Boulevard intersection mitigation is on a privately-owned roadway and should be coordinated with the property owner.)

M3. Intersection #5, Latrobe Road @ White Rock Road

This intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. Since the impact is identified under the Cumulative (2035) scenario, the timing of the improvement is a function of the rate of population and employment growth. The County's Traffic Impact Mitigation (TIM) fee program provides a mechanism for collecting fair share contributions for improvements in the 2018 CIP. Accordingly, prior to Building Permit Issuance, the project shall

provide to the County its proportionate share toward the costs of the identified improvements at this intersection.

The significant impact at this intersection can be mitigated by the addition of overlap right-turn signal phases at the northbound, westbound, and southbound approaches, as well as the optimization of the Latrobe Road coordinated signal system. In addition, the mitigation of this impact requires the signalization and coordination of the proposed project driveway (Intersection #6) with the existing Latrobe Road signal corridor. The addition of this new signal, by providing left-turn egress ability for the project, is effective in removing vehicles from the congested White Rock Road segment between Latrobe Road and Post Street, particularly for westbound left turns at Intersection #5 (Latrobe Road @ White Rock Road). This new signal's integration into, and expansion of the Latrobe Road signal corridor south of White Rock Road is anticipated to improve traffic progression by allowing for more structured vehicle platooning along this high speed, high volume corridor.

If constructed by others or added to the 20-year CIP prior to development levels in the project site that would require this mitigation, payment of traffic impact mitigation fees would satisfy the project's fair share obligation towards this improvement. If not constructed by others, the applicant would be responsible for implementing this improvement consistent with General Plan Goal TC-X and supporting Policy TC-Xf to ensure that transportation improvements are implemented concurrent with approved development. If constructed by the applicant, the applicant may be eligible for reimbursement through the County's traffic impact mitigation fee program.

In addition, the project may contribute its proportionate share to the County Department of Transportation's Intelligent Transportation System (ITS) program for the El Dorado Hills area, which is currently under development. If a signal at the project driveway were to be approved, fiber optic signal interconnect and conduit installation are required to provide coordinated signal operations. As shown in Table 25, this mitigation measure results in the intersection operating at LOS D in the AM and PM peak-hours. Therefore, this impact is **less than significant.**

Table 25 – Intersection Levels of Service –
Near-Term (2025) plus Proposed Project Mitigated Conditions

ID	Intersection	Control	Peak Hour	Near Term (2025) plus Proposed Project		Near Term (2025) plus Proposed Project (Mitigated)	
				Delay (sec)	LOS	Delay (sec)	LOS
4	Latrobe Rd @ Town Center Blvd	Signal	AM	20.9	C	21.1	C
			PM	**100.5**	**F**	63.2	E
5	Latrobe Rd @ White Rock Rd	Signal	AM	44.7	D	46.0	D
			PM	**98.3**	**F**	45.6	D

Notes:
Bold represents unacceptable operations. Shaded represents significant impact.

Cumulative (2035) plus Proposed Project Conditions

As reflected in Table 21, Table 22, and Table 23, the addition of the proposed project results in two (2) significant impacts. The following is a discussion of each of the impacts and its associated mitigation. Analysis worksheets for this scenario are provided in Appendix H.

Impacts:

Intersections

I4. Intersection #4, Latrobe Road @ Town Center Boulevard
As shown in Table 21, this intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. ***This is a significant impact.***

I5. Intersection #5, Latrobe Road @ White Rock Road
As shown in Table 21, this intersection operates at LOS F during the PM peak-hour without the project, and the project contributes more than 10 peak-hour trips to the intersection during the PM peak-hour. ***This is a significant impact.***

Mitigations:

Intersections

M4. Intersection #4, Latrobe Road @ Town Center Boulevard
The significant impact at this intersection can be mitigated by optimization of the Latrobe Road coordinated signal system, along with the following improvements: the restriping of the westbound Town Center Boulevard approach to include one left-through lane, and two right-turn lanes, with a permitted-overlap phase for the westbound right-turns. The El Dorado Hills Town Center Apartments project is responsible for, among other things, the lane designation and signal phasing mitigations described above.

The CIP includes a line item for unprogrammed traffic signal installation and operational and safety improvements at intersections, including improvements like construction of new traffic signals, construction of turn pockets, and the upgrade of existing traffic signal systems. The County annually monitors intersections with potential need for improvement through the Intersection Needs Prioritization Process. The Intersection Needs Prioritization Process is then used to inform the annual update to the CIP, and potential intersection improvements can be added, by the Board of Supervisors, to the CIP as funding becomes available. Therefore, appropriate mitigation, as determined by the CDS, would include payment of traffic impact mitigation fees to satisfy the project's fair share obligation towards this improvement or construction of the improvement with reimbursement for costs that exceed the project's proportional share if the improvement is needed but not included in future updates to the CIP or constructed by others.

As shown in Table 26, this mitigation measure results in the intersection operating at LOS D during the AM and LOS E during the PM peak-hour. Therefore, this impact is less than significant. In addition, the project may contribute its proportionate share to the County Department of Transportation's Intelligent Transportation System (ITS) program for the El Dorado Hills area, which is currently under development. If a signal at the project driveway were to be approved, fiber optic signal interconnect and conduit installation are required to provide coordinated signal operations. (Note: The Latrobe Road and Town Center Boulevard intersection mitigation is on a privately-owned roadway and should be coordinated with the property owner.)

M5. Intersection #5, Latrobe Road @ White Rock Road
This intersection operates at LOS F during the PM peak-hour without the project, and the project results in LOS F. Since the impact is identified under the Cumulative (2035) scenario, the timing

of the improvement is a function of the rate of population and employment growth. The County's Traffic Impact Mitigation (TIM) fee program provides a mechanism for collecting fair share contributions for improvements in the 2018 CIP. Accordingly, prior to Building Permit Issuance, the project shall provide to the County its proportionate share toward the costs of the identified improvements at this intersection.

The significant impact at this intersection can be mitigated by the addition of permitted-overlap right-turn phases as the northbound, westbound, and southbound approaches, and the optimization of the Latrobe Road coordinated signal system. In addition, the mitigation of this impact requires the signalization and coordination of the proposed project driveway (Intersection #6) with the existing Latrobe Road signal corridor. The addition of this new signal, by providing left-turn egress ability for the project, is effective in removing vehicles from the congested White Rock Road segment between Latrobe Road and Post Street, particularly for westbound left turns at Intersection #5 (Latrobe Road @ White Rock Road). This new signal's integration into, and expansion of the Latrobe Road signal corridor south of White Rock Road is anticipated to improve traffic progression by allowing for more structured vehicle platooning along this high speed, high volume corridor.

The CIP includes a line item for unprogrammed traffic signal installation and operational and safety improvements at intersections, including improvements like construction of new traffic signals, construction of turn pockets, and the upgrade of existing traffic signal systems. The County annually monitors intersections with potential need for improvement through the Intersection Needs Prioritization Process. The Intersection Needs Prioritization Process is then used to inform the annual update to the CIP, and potential intersection improvements can be added, by the Board of Supervisors, to the CIP as funding becomes available. Therefore, appropriate mitigation, as determined by the CDS, would include payment of traffic impact mitigation fees to satisfy the project's fair share obligation towards this improvement or construction of the improvement with reimbursement for costs that exceed the project's proportional share if the improvement is needed but not included in future updates to the CIP or constructed by others.

In addition, the project may contribute its proportionate share to the County Department of Transportation's Intelligent Transportation System (ITS) program for the El Dorado Hills area, which is currently under development. If a signal at the project driveway were to be approved, fiber optic signal interconnect and conduit installation are required to provide coordinated signal operations. As shown in Table 26, this mitigation measure results in the intersection operating at LOS E in the AM and PM peak-hours. Therefore, this impact is **less than significant.**

Table 26 – Intersection Levels of Service –
Cumulative (2035) plus Proposed Project Mitigated Conditions

ID	Intersection	Control	Peak Hour	Cumulative (2035) plus Proposed Project		Cumulative (2035) plus Proposed Project (Mitigated)

OTHER CONSIDERATIONS

Intersection Queuing Evaluation

Vehicle queuing for critical movements at five (5) of the study intersections was evaluated. The calculated vehicle queues were compared to actual or anticipated vehicle storage lengths. Results of the queuing evaluation are presented in Table 27. Analysis sheets that include the anticipated vehicle queues are presented in Appendices B-H. As presented in Table 27, the addition of the proposed project adds a modest amount of additional queuing to these movements.

The addition of the proposed project results in the following:

- An increase in the northbound left-turn queue at Intersection #2 under Cumulative (2035) "plus project" Mitigated conditions, exceeding available storage by one vehicle.
- An increase in the eastbound right-turn queue at Intersection #3 under Near-Term (2025) and Cumulative (2035) "plus project" conditions, which exceeds the available storage capacity under "no-project" conditions. Under both Near-Term (2025) Mitigated and Cumulative (2035) Mitigated PM peak-hour conditions, the queue is reduced to acceptable lengths. Under Cumulative (2035) "plus- project" Mitigated AM peak-hour conditions, the queue is reduced below "no-project" conditions.
- An increase of less than one vehicle in the westbound left-turn queue at Intersection #5, which exceeds the available storage capacity under all "no-project" conditions. Under Cumulative (2035) "plus- project" Mitigated conditions, the queue is reduced below "no-project" conditions.
- An increase of less than four vehicles in the northbound left-turn queue at Intersection #5 under Near-Term (2025) and Cumulative (2035) "plus project" conditions, which exceeds the available storage capacity under "no-project" conditions.
- An increase of less than two vehicles in the westbound left-turn queue at Intersection #12, which exceeds the available storage capacity under both Near-Term (2025) and Cumulative (2035) "no-project" conditions.

As reflected in Table 27, the addition of the proposed project results in conditions at two locations that warrant modifications by the proposed project. The following is a discussion of each of these conditions.

Intersection #5, Latrobe Road @ White Rock Road
As shown in Table 27, the addition of the proposed project increases northbound left-turn queues from 214-feet to 309-feet in the PM peak-hour, with available storage capacity of 270-feet. Per the County's request, the applicant should mitigate this condition by lengthening the left turn pocket to 330-feet, based on the AM queue length of 327-feet.

Intersection #12, Post Street @ White Rock Road
As shown in Table 27, the addition of the proposed project increases westbound left-turn queues from 115-feet to 160-feet in the PM peak-hour, with available storage capacity of 120-feet. Per the County's request, the queue from westbound White Rock Road into the Project Driveway/Post Street should be monitored. Should the County determine queue spillbacks for this movement, the applicant will be responsible for retiming the signal.

On-Site Transportation Review

In accordance with the County's *Guidelines*[17], the following aspects of the proposed project were evaluated.

1. ***Existence of any current traffic problems in the local area such as a high-accident location, non-standard intersection or roadway, or an intersection in need of a traffic signal.***

   According to the County's 2017 *Accident Location Study*[18], several study area sites (i.e., intersections and roadway segments) experienced three (3) or more accidents during a three-year period between January 1, 2015, and December 31, 2017. According to the Study, these sites were selected for investigation and determination of corrective action(s). Table 28 provides a summary of the study area sites and their selected actions.

Table 28 – Project Area Sites Selected for Accident Investigation

Site #	Location Description	Accident Rate[+]	Identified Action
12	El Dorado Hills Blvd, vicinity of Saratoga Wy	1.33	S & D Review
24	Latrobe Rd, vicinity of Golden Foothill Pkwy	0.34	None Required
25	Latrobe Rd, vicinity of White Road Rd	0.50	None Required
41	Silva Valley Pkwy, vicinity of White Rock Rd	0.17	None Required
42	White Rock Rd, vicinity of Latrobe Rd	0.65	None Required
43	White Rock Rd, vicinity of Valley View Pkwy	0.73	None Required

Source: *Annual Accident Location Study 2017*, County of El Dorado Department of Transportation, April 12, 2018.
[+] # Accidents per Million Entering Vehicles (MEV)

According to the *Study*, five sites "do not require further review at this time. However, these sites will continue to be monitored and any subsequent increase in the frequency of accidents may necessitate further review and analysis." One site has been identified as a location requiring further review due to "high accident rates and/or severity. A further review will be made of [the] site, consisting of analysis of the accident history and collection of field measurements. Based on the findings of the investigation, requests or recommendations for improvement shall be prepared and processed."

Peak-Hour Traffic Signal Warrant Evaluation

A planning level assessment of the need for traffic signalization was performed for the un-signalized study intersection #14 (Silva Valley Parkway @ Tong Road). In addition, the Latrobe Road intersection with the Project Driveway (Intersection #6) was evaluated based on volumes assuming both left- and right-turns can be made onto Latrobe Road. Intersection #6 was evaluated as un-signalized in the analysis scenarios; however, the signalization of intersection #6 is included in mitigations M3 and M5 discussed above. If a signal is not approved, mitigations M3 and M5 would have to be reevaluated without this assumption. This evaluation was performed consistently with the peak-hour warrant methodologies noted in Section 4C of the *California Manual on Uniform Traffic Control Devices (CMUTCD), 2014 Edition (with April 2017 revisions)*. A summary of the peak-hour warrant results is presented in Table 29.

[17] *Transportation Impact Study Guidelines,* El Dorado County Community Development Agency, November 2014.
[18] *Annual Accident Location Study 2017*, County of El Dorado Department of Transportation, April 12,2018.

Table 29 – Traffic Signal Warrant Analysis Results

#	Intersection	Analysis Scenario					
		Existing	Existing plus PP	Near-Term (2025)	Near-Term (2025) plus PP	Cum (2035)	Cum (2035) plus PP
6	Latrobe Rd @ Project Dwy	-	No / Yes	-	No / Yes	-	No / Yes
14	Silva Valley Pkwy @ Tong Rd	No / No	No / No	No / No	No / No	No / No	No / No

Results are presented in AM / PM format.
Note: Peak-hour warrant is satisfied if Condition A or B is satisfied.

As shown in Table 29, the addition of the proposed project does not result in the peak-hour signal warrant being satisfied at the Silva Valley Parkway intersection with Tong Road. Detailed results of this analysis are presented in Appendix I.

2. *Proximity of proposed site driveway(s) to other driveways or intersections.*
The site plan for the proposed project (Figure 2) was qualitatively reviewed for general access and on-site circulation. According to the site plan, primary access to the site will be provided from White Rock Road at the existing Post Street signalize intersection. Three secondary driveways will serve the site; one existing right-in/right-out driveway along White Rock Road, one new right-in/right-out driveway along Latrobe Road at the south end of the project site, and one new left-in/right-in/right-out driveway along Latrobe Road. Detailed LOS and delay data were previously reported for the White Rock Road intersection with Post Street (Intersection #12) and the Latrobe Road intersection with the site access driveway (Intersection #6). The combination of these access points, as well as the on-site circulation system appears to provide adequate access to/from White Rock Road and Latrobe road and the surrounding transportation network.

3. *Adequacy of vehicle parking relative to both the anticipated demand and zoning code requirements.*
The project site plan (Figure 2) will accommodate more than 526 parking stalls. According to El Dorado County Code of Ordinances Article 3, Chapter 130.35, the project is required to provide a minimum of 429 parking stalls (1.2 stalls per hotel room and 1 stall per 400 square feet of retail).

4. *Adequacy of the project site design to fully satisfy truck loading demand on-site, when the anticipated number of deliveries and service calls may exceed 10 per day.*
The project site is understood to be designed with appropriately designated truck loading/unloading zones to minimize these activities' impact to the site's parking supply. We understand that time restrictions may be applied as an additional strategy by which to control the effect of the site's truck activities on traditional operations.

5. *Adequacy of the project site design to provide at least a 25' minimum required throat depth (MRTD) at project driveways. Include calculation of the MRTD.*
According to the project site plan (Figure 2), the two new site driveways provide at least 25-feet of MRTD. This is the throat depth required based on the methodology presented in *Estimation of Maximum Queue Lengths at Unsignalized Intersections* (ITE Journal, November 2001). Both project driveways contain medians with at least 100 feet of storage until the first drive aisle. This storage is shown to be more than adequate based on queuing reports contained in Appendix C, Appendix E, and Appendix G.

6. *Adequacy of the project site design to convey all vehicle types.*
The site is anticipated to accommodate the circulation needs of all vehicle types, including fire access. According to the project site plan (Figure 2), the project site includes a traffic circle to accommodate traffic flows between project buildings and available driveways.

7. Queuing Analysis of "Drive-through" Facility
   The project site plan (Figure 2) depicts drive-through queuing space for 10 vehicles at the proposed drive-through restaurant. Although not depicted, the County's *Community Design Standards*, Section 4.4, subsection H, states, "the stacking lane should accommodate a minimum of four cars per drive-through window, in addition to the car receiving service." Recently collected drive-through queuing data for three similarly sized fast food restaurants in South Placer County reveal a maximum queue of 13 vehicles or 325-feet (see data provided in Appendix J). Considering the relatively consistent suburban locations and anticipated uses, the proposed project is expected to experience maximum drive-through queuing that exceeds the available storage. The result of this condition will result in spillback into the adjacent drive aisle and will have the potential to impede on-site vehicle and pedestrian movements. While temporary on-site queuing associated with this drive-through facility is not anticipated to result in off-site operational or safety concerns, the project should consider adding "KEEP CLEAR" striping along the main access driveway to reduce the likelihood of a standing vehicle queue along this driveway during peak periods of operation.

8. *Adequacy of sight distance on-site.*
   An evaluation of sight distance was completed for the two site driveways, one proposed along Latrobe Road and one existing along White Rock Road, based on observed horizontal and vertical geometric conditions. These evaluations were performed in accordance with the guidelines presented in the *Geometric Design of Highways and Streets,* published by the American Associate of State Highway and Transportation Officials (AASHTO), and the Highway Design Manual, published by Caltrans. Adequate sight distance was observed at both driveway intersections. Nevertheless, in all cases, roadside vegetation should be maintained to preserve sight distance. In addition, according to the project site plan (Figure 2) there appears to be adequate sight distance on-site to facilitate safe and orderly circulation.

Other Transportation-Related Impacts and Mitigation Considerations

In accordance with the County's *Guidelines*[1], the proposed project was evaluated against the following *General Plan* goals:

- *Emergency Vehicle Access*
  Fire Safe Regulations[19] state that on-site roadways shall "provide for safe access for emergency wildland fire equipment and civilian evacuation concurrently, and shall provide unobstructed traffic circulation during a wildfire emergency…" All project roadways shall be designed and constructed in accordance with these requirements. The proposed project is considered to allow for adequate access and on-site circulation for emergency vehicles.

- *Deliveries of Goods and Services*
  The proposed project is considered to allow for adequate on-site circulation for all vehicle types, including delivery vehicles for goods and services. Delivery vehicles will be able access various drop off lanes during off-peak hours, but more appropriately, will be able to pull curbside in front of the administration office for routine package/mail and supply delivery. The site layout will enable them to use the complete loop road around the campus.

- *Access to Public Transit Services consistent with General Plan Circulation Element Goal TC-2: "To promote a safe and efficient transit system that provides service to all residents, including senior citizens, youths, the disabled, and those without access to automobiles that also helps to reduce congestion, and improves the environment."*

[19] *Fire Safe Regulations*, Title 14 Natural Resources, Division 1.5 Department of Forestry, Chapter 7 – Fire Protection, Subchapter 2 SRA Safe Regulations, Article 2 Emergency Access, El Dorado County Building Department.

The El Dorado Transit Sacramento Commuter and Cameron Park/El Dorado Hills routes provide service along Latrobe Road north of White Rock Road, and along White Rock Road between Latrobe Road and Valley View Parkway, in the project vicinity. Adequate access to existing transit stop locations on White Rock Road should be provided.

- *Transportation System Management consistent with General Plan Circulation Element Goal TC-3: "To reduce travel demand on the County's road system and maximize the operating efficiency of transportation facilities, thereby reducing the quantity of motor vehicle emissions and the amount of investment required in new or expanded facilities."*
  The proposed project driveway on Latrobe Road, if signalized, would alleviate congestion on the White Rock Road segment between Latrobe Road and Post Street by improving access to the project site via Latrobe Road. The addition of this new signal, by providing left-turn egress ability for the project, is effective in removing vehicles from the congested White Rock Road segment between Latrobe Road and Post Street, particularly for westbound left turns at Intersection #5 (Latrobe Road @ White Rock Road). This new signal's integration into, and expansion of the Latrobe Road signal corridor south of White Rock Road is anticipated to improve traffic progression by allowing for more structured vehicle platooning along this high speed, high volume corridor.
- *Non-Motorized Transportation consistent with General Plan Circulation Element Goal TC-4: "To provide a safe, continuous, and easily accessible non-motorized transportation system that facilitates the use of the viable alternative transportation modes."*
  According to the *El Dorado County Bicycle Transportation Plan*, Class II Bike Lanes exist along White Rock Road and Latrobe Road in the vicinity of the project site. While the project will not result in removal of a bikeway/bike lane or prohibition of implementation of the facilities identified in the *Plan*, it is required to include pedestrian/bicycle paths connecting to adjacent commercial, research and development, or industrial projects and any schools, parks, or other public facilities. The proposed project will be required to construct on-site roadway and pedestrian facilities in accordance with County design guidelines. These on-site pedestrian and bicycle facilities will connect the project with the existing Class II Bike Lanes along White Rock Road and Latrobe Road. Through these connections to the proposed bike lane network, the project will provide continuity with adjacent projects, schools, parks, and other public facilities.

CONCLUSIONS

Significant findings of this study include:

- The proposed project is estimated to generate approximately 4,400 new daily trips, with 128 new trips occurring during the AM peak-hour, and 382 new trips occurring during the PM peak-hour.
- The County's Travel Demand Model (TDM) does not account for the project's proposed land uses and, because the County's TDM does not assume the project's employment growth in TAZ 172, the *General Plan's* cumulative traffic analysis cannot serve as the basis for the Cumulative (2035) traffic analysis of the project. As such, Cumulative (2035) conditions are included in this evaluation.
- As defined by the County, the addition of the proposed project to the Existing, Near-Term (2025), and Cumulative (2035) scenarios significantly worsens conditions at multiple study intersections. All of these impacts can be mitigated to be ***less than significant***.

		Percent free flow speed, PFFS	*76.7* %

Percent Time-Spent-Following

	Analysis Direction (d)	Opposing Direction (o)
Passenger-car equivalents for trucks, E_T(Exhibit 15-18 or 15-19)	*1.1*	*1.0*
Passenger-car equivalents for RVs, E_R (Exhibit 15-18 or 15-19)	*1.0*	*1.0*
Heavy-vehicle adjustment factor, $f_{HV}=1/(1+P_T(E_T-1)+P_R(E_R-1))$	*0.998*	*1.000*
Grade adjustment factor[1], $f_{g,PTSF}$ (Exhibit 15-16 or Ex 15-17)	*1.00*	*1.00*
Directional flow rate[2], v_i(pc/h) $v_i=V_i/(PHF*f_{HV,PTSF}*f_{g,PTSF})$	*324*	*803*
Base percent time-spent-following[4], $BPTSF_d(\%)=100(1-e^{av_d^b})$	*42.6*	
Adj. for no-passing zone, $f_{np,PTSF}$ (Exhibit 15-21)	*28.7*	
Percent time-spent-following, $PTSF_d(\%)=BPTSF_d+f_{np,PTSF}*(v_{d,PTSF}/v_{d,PTSF}+v_{o,PTSF})$	*50.9*	

Level of Service and Other Performance Measures

Level of service, LOS (Exhibit 15-3)	*C*
Volume to capacity ratio, *v/c*	*0.19*

Capacity, $C_{d,ATS}$ (Equation 15-12) pc/h	*1697*
Capacity, $C_{d,PTSF}$ (Equation 15-13) pc/h	*1700*
Percent Free-Flow Speed $PFFS_d$(Equation 15-11 - Class III only)	*76.7*
Bicycle Level of Service	
Directional demand flow rate in outside lane, v_{OL} (Eq. 15-24) veh/h	*323.3*
Effective width, Wv (Eq. 15-29) ft	*24.00*
Effective speed factor, S_t (Eq. 15-30)	*4.42*
Bicycle level of service score, BLOS (Eq. 15-31)	*2.18*
Bicycle level of service (Exhibit 15-4)	*B*
Notes	
1. Note that the adjustment factor for level terrain is 1.00,as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain. 2. If v_i(v_d or v_o) >=1,700 pc/h, terminate analysis--the LOS is F. 3. For the analysis direction only and for v>200 veh/h. 4. For the analysis direction only 5. Exhibit 15-20 provides coefficients a and b for Equation 15-10. 6. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Base percent time-spent-following[4], $BPTSF_d(\%)=100(1-e^{av_d^b})$	*61.3*	
Adj. for no-passing zone, $f_{np,PTSF}$ (Exhibit 15-21)	*30.2*	
Percent time-spent-following, $PTSF_d(\%)=BPTSF_d+f_{np,PTSF}*(v_{d,PTSF}/v_{d,PTSF}+v_{o,PTSF})$	*82.8*	

Level of Service and Other Performance Measures

Level of service, LOS (Exhibit 15-3)	*D*
Volume to capacity ratio, *v/c*	*0.44*

Capacity, $C_{d,ATS}$ (Equation 15-12) pc/h	*1686*
Capacity, $C_{d,PTSF}$ (Equation 15-13) pc/h	*1697*
Percent Free-Flow Speed $PFFS_d$(Equation 15-11 - Class III only)	*73.2*
Bicycle Level of Service	
Directional demand flow rate in outside lane, v_{OL} (Eq. 15-24) veh/h	*743.0*
Effective width, Wv (Eq. 15-29) ft	*24.00*
Effective speed factor, S_t (Eq. 15-30)	*4.42*
Bicycle level of service score, BLOS (Eq. 15-31)	*2.60*
Bicycle level of service (Exhibit 15-4)	*C*
Notes	

1. Note that the adjustment factor for level terrain is 1.00,as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i(v_d or v_o) >=1,700 pc/h, terminate analysis--the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only
5. Exhibit 15-20 provides coefficients a and b for Equation 15-10.
6. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Directional Two-Lane Highway Segment Analysis

Analyst	Kimley-Horn
Agency/Co.	
Date Performed	1/25/2016
Analysis Time Period	AM EB
Highway	White Rock Road
From/To	Post to Valley View
Jurisdiction	
Analysis Year	Existing plus Project 2015
Description	

Input Data

Highway class	Class 3		Peak hour factor, PHF	0.86	
Shoulder width	6.0	ft	% Trucks and buses	2	%
Lane width	12.0	ft	% Trucks crawling	0.0	%
Segment length	0.3	mi	Truck crawl speed	0.0	mi/hr
Terrain type	Rolling		% Recreational vehicles	0	%
Grade: Length	-	mi	% No-passing zones	100	%
Up/down	-	%	Access point density	9	/mi

Analysis direction volume, Vd 294 veh/h
Opposing direction volume, Vo 768 veh/h

Average Travel Speed

Direction	Analysis(d)		Opposing (o)	
PCE for trucks, ET	2.1		1.3	
PCE for RVs, ER	1.1		1.1	
Heavy-vehicle adj. factor,(note-5) fHV	0.978		0.994	
Grade adj. factor,(note-1) fg	0.86		1.00	
Directional flow rate,(note-2) vi	406	pc/h	898	pc/h

Free-Flow Speed from Field Measurement:

Field measured speed,(note-3) S FM	-	mi/h
Observed total demand,(note-3) V	-	veh/h

Estimated Free-Flow Speed:

Base free-flow speed,(note-3) BFFS	45.0	mi/h
Adj. for lane and shoulder width,(note-3) fLS	0.0	mi/h
Adj. for access point density,(note-3) fA	2.3	mi/h
Free-flow speed, FFSd	42.8	mi/h
Adjustment for no-passing zones, fnp	1.2	mi/h
Average travel speed, ATSd	31.5	mi/h
Percent Free Flow Speed, PFFS	73.6	%

Percent Time-Spent-Following

Direction	Analysis(d)	Opposing (o)
PCE for trucks, ET	1.6	1.0
PCE for RVs, ER	1.0	1.0
Heavy-vehicle adjustment factor, fHV	0.988	1.000
Grade adjustment factor,(note-1) fg	0.87	1.00
Directional flow rate,(note-2) vi	398 pc/h	893 pc/h
Base percent time-spent-following,(note-4) BPTSFd	49.3 %	
Adjustment for no-passing zones, fnp	26.3	
Percent time-spent-following, PTSFd	57.4 %	

Level of Service and Other Performance Measures

Level of service, LOS	D	
Volume to capacity ratio, v/c	0.24	
Peak 15-min vehicle-miles of travel, VMT15	26	veh-mi
Peak-hour vehicle-miles of travel, VMT60	88	veh-mi
Peak 15-min total travel time, TT15	0.8	veh-h
Capacity from ATS, CdATS	1690	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1690	veh/h

Passing Lane Analysis

Total length of analysis segment, Lt	0.3	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	31.5	mi/h
Percent time-spent-following, PTSFd (from above)	57.4	
Level of service, LOSd (from above)	D	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	45
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	341.9
Effective width of outside lane, We	24.00
Effective speed factor, St	4.42
Bicycle LOS Score, BLOS	2.21
Bicycle LOS	B

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	45
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	1070.8
Effective width of outside lane, We	24.00
Effective speed factor, St	4.42
Bicycle LOS Score, BLOS	2.79
Bicycle LOS	C

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Directional Two-Lane Highway Segment Analysis

Analyst	Kimley-Horn
Agency/Co.	
Date Performed	1/25/2016
Analysis Time Period	PM WB
Highway	White Rock Road
From/To	Valley View to Post
Jurisdiction	
Analysis Year	Existing plus Project 2015
Description	

Input Data

Highway class	Class 3		Peak hour factor, PHF	0.95	
Shoulder width	6.0	ft	% Trucks and buses	2	%
Lane width	12.0	ft	% Trucks crawling	0.0	%
Segment length	0.3	mi	Truck crawl speed	0.0	mi/hr
Terrain type	Level		% Recreational vehicles	0	%
Grade: Length	-	mi	% No-passing zones	100	%
Up/down	-	%	Access point density	9	/mi

Analysis direction volume, Vd 592 veh/h
Opposing direction volume, Vo 953 veh/h

Average Travel Speed

Direction	Analysis(d)		Opposing (o)	
PCE for trucks, ET	1.1		1.0	
PCE for RVs, ER	1.0		1.0	
Heavy-vehicle adj. factor,(note-5) fHV	0.998		1.000	
Grade adj. factor,(note-1) fg	1.00		1.00	
Directional flow rate,(note-2) vi	624	pc/h	1003	pc/h

Free-Flow Speed from Field Measurement:

Field measured speed,(note-3) S FM	-	mi/h
Observed total demand,(note-3) V	-	veh/h

Estimated Free-Flow Speed:

Base free-flow speed,(note-3) BFFS	45.0	mi/h
Adj. for lane and shoulder width,(note-3) fLS	0.0	mi/h
Adj. for access point density,(note-3) fA	2.3	mi/h
Free-flow speed, FFSd	42.8	mi/h
Adjustment for no-passing zones, fnp	1.1	mi/h
Average travel speed, ATSd	29.0	mi/h
Percent Free Flow Speed, PFFS	67.9	%

Percent Time-Spent-Following

Direction	Analysis(d)	Opposing (o)
PCE for trucks, ET	1.0	1.0
PCE for RVs, ER	1.0	1.0
Heavy-vehicle adjustment factor, fHV	1.000	1.000
Grade adjustment factor,(note-1) fg	1.00	1.00
Directional flow rate,(note-2) vi	623 pc/h	1003 pc/h
Base percent time-spent-following,(note-4) BPTSFd	63.8 %	
Adjustment for no-passing zones, fnp	22.8	
Percent time-spent-following, PTSFd	72.5 %	

Level of Service and Other Performance Measures

Level of service, LOS	D	
Volume to capacity ratio, v/c	0.37	
Peak 15-min vehicle-miles of travel, VMT15	47	veh-mi
Peak-hour vehicle-miles of travel, VMT60	178	veh-mi
Peak 15-min total travel time, TT15	1.6	veh-h
Capacity from ATS, CdATS	1700	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1700	veh/h

Passing Lane Analysis

Total length of analysis segment, Lt	0.3	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	29.0	mi/h
Percent time-spent-following, PTSFd (from above)	72.5	
Level of service, LOSd (from above)	D	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi

Directional Two-Lane Highway Segment Analysis

Analyst	Kimley-Horn
Agency/Co.	
Date Performed	1/25/2016
Analysis Time Period	AM EB
Highway	White Rock Road
From/To	Post to Valley View
Jurisdiction	
Analysis Year	Near-Term 2025
Description	

Input Data

Highway class	Class 3		Peak hour factor, PHF	0.92	
Shoulder width	6.0	ft	% Trucks and buses	2	%
Lane width	12.0	ft	% Trucks crawling	0.0	%
Segment length	0.3	mi	Truck crawl speed	0.0	mi/hr
Terrain type	Level		% Recreational vehicles	0	%
Grade: Length	-	mi	% No-passing zones	100	%
Up/down	-	%	Access point density	9	/mi

Analysis direction volume, Vd 463 veh/h
Opposing direction volume, Vo 1245 veh/h

Average Travel Speed

Direction	Analysis(d)		Opposing (o)	
PCE for trucks, ET	1.2		1.0	
PCE for RVs, ER	1.0		1.0	
Heavy-vehicle adj. factor,(note-5) fHV	0.996		1.000	
Grade adj. factor,(note-1) fg	1.00		1.00	
Directional flow rate,(note-2) vi	505	pc/h	1353	pc/h

Free-Flow Speed from Field Measurement:

Field measured speed,(note-3) S FM	-	mi/h
Observed total demand,(note-3) V	-	veh/h

Estimated Free-Flow Speed:

Base free-flow speed,(note-3) BFFS	45.0	mi/h
Adj. for lane and shoulder width,(note-3) fLS	0.0	mi/h
Adj. for access point density,(note-3) fA	2.3	mi/h
Free-flow speed, FFSd	42.8	mi/h
Adjustment for no-passing zones, fnp	0.8	mi/h
Average travel speed, ATSd	27.6	mi/h
Percent Free Flow Speed, PFFS	64.5	%

Percent Time-Spent-Following

Direction	Analysis(d)	Opposing (o)
PCE for trucks, ET	1.0	1.0
PCE for RVs, ER	1.0	1.0
Heavy-vehicle adjustment factor, fHV	1.000	1.000
Grade adjustment factor,(note-1) fg	1.00	1.00
Directional flow rate,(note-2) vi	503 pc/h	1353 pc/h
Base percent time-spent-following,(note-4) BPTSFd	61.2 %	
Adjustment for no-passing zones, fnp	16.2	
Percent time-spent-following, PTSFd	65.6 %	

Level of Service and Other Performance Measures

Level of service, LOS	E	
Volume to capacity ratio, v/c	0.30	
Peak 15-min vehicle-miles of travel, VMT15	38	veh-mi
Peak-hour vehicle-miles of travel, VMT60	139	veh-mi
Peak 15-min total travel time, TT15	1.4	veh-h
Capacity from ATS, CdATS	1700	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1700	veh/h

Passing Lane Analysis

Total length of analysis segment, Lt	0.3	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	27.6	mi/h
Percent time-spent-following, PTSFd (from above)	65.6	
Level of service, LOSd (from above)	E	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	45
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	503.3
Effective width of outside lane, We	24.00
Effective speed factor, St	4.42
Bicycle LOS Score, BLOS	2.40
Bicycle LOS	B

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Directional Two-Lane Highway Segment Analysis

Analyst	Kimley-Horn
Agency/Co.	
Date Performed	1/25/2016
Analysis Time Period	PM EB
Highway	White Rock Road
From/To	Post to Valley View
Jurisdiction	
Analysis Year	Near-Term 2025
Description	

Input Data

Highway class	Class 3		Peak hour factor, PHF	0.92	
Shoulder width	6.0	ft	% Trucks and buses	2	%
Lane width	12.0	ft	% Trucks crawling	0.0	%
Segment length	0.3	mi	Truck crawl speed	0.0	mi/hr
Terrain type	Level		% Recreational vehicles	0	%
Grade: Length	-	mi	% No-passing zones	100	%
Up/down	-	%	Access point density	9	/mi

Analysis direction volume, Vd	1199	veh/h
Opposing direction volume, Vo	844	veh/h

Average Travel Speed

Direction	Analysis (d)		Opposing (o)	
PCE for trucks, ET	1.0		1.0	
PCE for RVs, ER	1.0		1.0	
Heavy-vehicle adj. factor, (note-5) fHV	1.000		1.000	
Grade adj. factor, (note-1) fg	1.00		1.00	
Directional flow rate, (note-2) vi	1303	pc/h	917	pc/h

Free-Flow Speed from Field Measurement:		
Field measured speed, (note-3) S FM	-	mi/h
Observed total demand, (note-3) V	-	veh/h
Estimated Free-Flow Speed:		
Base free-flow speed, (note-3) BFFS	45.0	mi/h
Adj. for lane and shoulder width, (note-3) fLS	0.0	mi/h
Adj. for access point density, (note-3) fA	2.3	mi/h
Free-flow speed, FFSd	42.8	mi/h
Adjustment for no-passing zones, fnp	1.1	mi/h
Average travel speed, ATSd	24.4	mi/h
Percent Free Flow Speed, PFFS	57.0	%

Percent Time-Spent-Following

Direction	Analysis(d)	Opposing (o)
PCE for trucks, ET	1.0	1.0
PCE for RVs, ER	1.0	1.0
Heavy-vehicle adjustment factor, fHV	1.000	1.000
Grade adjustment factor,(note-1) fg	1.00	1.00
Directional flow rate,(note-2) vi	1303 pc/h	917 pc/h
Base percent time-spent-following,(note-4) BPTSFd	83.8 %	
Adjustment for no-passing zones, fnp	14.8	
Percent time-spent-following, PTSFd	92.5 %	

Level of Service and Other Performance Measures

Level of service, LOS	E	
Volume to capacity ratio, v/c	0.77	
Peak 15-min vehicle-miles of travel, VMT15	98	veh-mi
Peak-hour vehicle-miles of travel, VMT60	360	veh-mi
Peak 15-min total travel time, TT15	4.0	veh-h
Capacity from ATS, CdATS	1700	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1700	veh/h

Passing Lane Analysis

Total length of analysis segment, Lt	0.3	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	24.4	mi/h
Percent time-spent-following, PTSFd (from above)	92.5	
Level of service, LOSd (from above)	E	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	45
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	1303.3
Effective width of outside lane, We	24.00
Effective speed factor, St	4.42
Bicycle LOS Score, BLOS	2.89
Bicycle LOS	C

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

MULTILANE HIGHWAY SEGMENT ANALYSIS

File Name:	Near-TermPP_AM_Latrobe.xhm
Analyst:	
Agency:	
Jurisdiction:	
Date:	7/19/2017
Analysis Year:	2017
Time Period Analyzed:	
Project Description:	
Units:	U.S. Customary

Direction 1: NB

LOS and Performance Measures

Flow rate, v_p	1470	pc/h/ln
Capacity, C	4192	pc/h/ln
Speed, S	54.8	mi/h
Density, D	13.4	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Median Type	Divided	
Access Point Density	1.0	access points/mi
Demand Volume, V	1325	veh/h
Peak Hour Factor, PHF	0.92	
Percent Total Trucks	2.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	55.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Total Lateral Clearance, TLC	12.00	ft
Total Lateral Clearance Adjustment, fTLC	0.0	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	1.0	access points/mi
Access Point Density Adjustment, fA	0.3	mi/h
Free-Flow Speed, FFS	54.8	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	54.8	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	54.8	mi/h
Capacity, c	2096	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2096	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1325	veh/h
Peak Hour Factor, PHF	0.92	
Number of Lanes, N	2	ln

Adjusted Free-Flow Speed, FFSadj	43.4	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	43.4	mi/h
Capacity, c	1900	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	1900	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1047	veh/h
Peak Hour Factor, PHF	0.92	
Number of Lanes, N	3	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	2.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.0200	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.980	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	387	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	387	pc/h/ln
Free-Flow Speed, FFS	45.0	mi/h
Capacity, c	1900	pc/h/ln
Breakpoint, BP	1400	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	43.4	mi/h
Density, D	8.9	pc/mi/ln
Level of service, LOS	A	

Bicycle Level of Service

Hourly Directional Volume, V	1047	veh
Peak Hour Factor, PHF	0.92	
Number of Directional Lanes, N	3	ln
Directional Demand Flow Rate in Outside Lane, vOL	379	veh/ln
Percent of Segment with Occupied On-Highway Parking, %OHP	0	
Paved Shoulder Width, Ws	6	ft
Effective Width as a Function of Traffic Volume, Wv	18	ft
Average Effective Width of Outside Lane, We	24	ft
Posted Speed Limit, Sp	50	mi/h
Effective Speed Factor, St	4.62	
Percentage of Heavy Vehicles, HV	0.0200	
Pavement Condition Rating, P	4	
Bicycle Level of Service Score, BLOS	2.68

ApproachDel:	xxxxxx			xxxxxx			xxxxxx			11.0		

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.0]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=13]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=2320]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.
